

03-02 Managing Computers

Create a computer account:

```
New-ADComputer -Name "Client02"  
New-ADComputer -Name "Client03" -SamAccountName "Client03"
```

SAM is the security account manager name. If we leave the SAM portion off of the commandlet, it would be added automatically using the same name as the computer name.

```
New-ADComputer -Name "Client04" -SamAccountName "Client04" -Path  
"OU=test,DC=linkedin,DC=int" -Enabled $true  
  
New-ADComputer -Name "Client05" -SamAccountName "Client05" -Path  
"OU=test,DC=linkedin,DC=int" -Enabled $true -Location  
"Redmond,WA"
```

Create variables to autofill specific locations:

```
$ComputerName = "<ComputerName>"  
$OUPath = "OU=test,DC=linkedin,DC=int"  
$Location= "Seattle"
```

The OU path and the location are always going to be the same no matter how many times you run the command, but the computername is going to be specified each time so we don't end up with two computers with the same name.

```
New-ADComputer -Name "Client11" -SamAccountName "Client11" -  
Path $OUPath -location $Location
```
