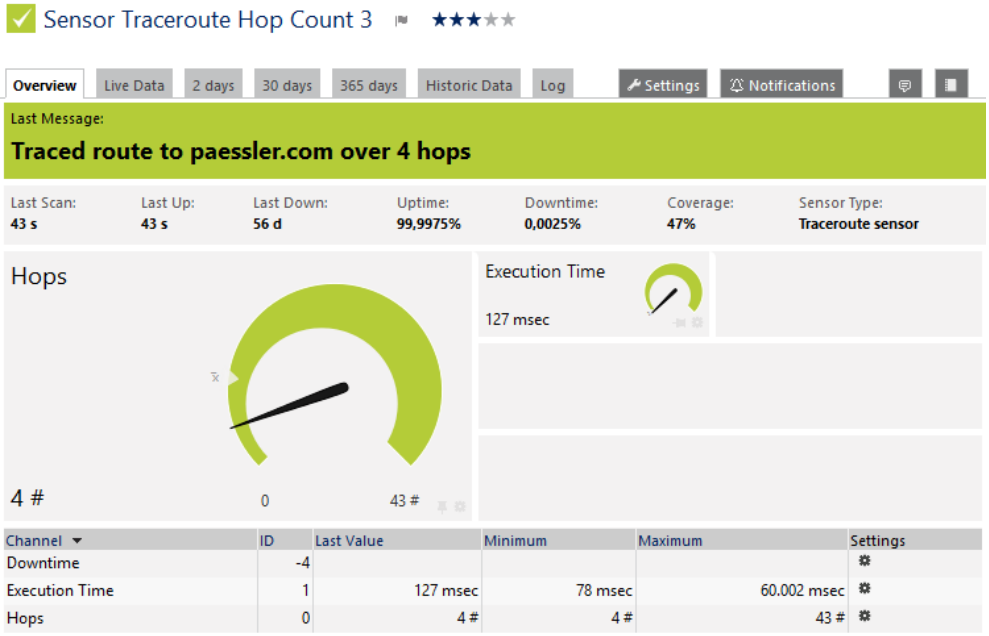
- If the number of hops (the route) changes, you can additionally define another sensor status [163].



Traceroute Hop Count Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/traceroute_hop_count.png

Remarks

- Requires [2336] .NET 4.0 or 4.5 to be installed on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

	You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

If Route Changes	Define what to do if the route has changed since the last check. Choose between: ▪ **Ignore**: Do not perform any action. ▪ **Set sensor to "Warning"**: Set the sensor to **Warning** status. ▪ **Set sensor to "Error"**: Set the sensor to **Down** status.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.196 VMware Datastore (SOAP) Sensor

The VMware Datastore (SOAP) sensor monitors the disk usage of a VMware data store using Simple Object Access Protocol (SOAP). It can show the following:

- Available capacity in bytes: This is the physically or virtually available size of the data store.
- Free space in bytes and percent: This is the disk space that is not used by virtual machines. Used disk space can be either thick-provisioned or used from thin-provisioned virtual disks.
- Uncommitted bytes: This is the disk space that is provisioned for thin-provisioned virtual machines but not used yet.
- Total provisioned disk space in percent: This is the sum of all potentially used disk space of thin-provisioned and thick-provisioned VM hard drives (uncommitted bytes plus used bytes).
- Accessibility of the data store

VMware Datastore (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_datastore_soap.png

Remarks

- Requires 2345 .NET 4.0 or higher to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, or 6.0 or vCenter.

- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor type supersedes the outdated SSH VMWare ESX(i) Disk sensor. We recommend that you use this new sensor to monitor VMware data stores.
- Knowledge Base: I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3183.
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2782.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using remote probes 3196 or when running a cluster 116 setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the data stores you want to monitor. PRTG creates one sensor for each data store you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

DATASTORE SETTINGS

Datastore	Select all data stores for which you want to add a sensor. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATASTORE SETTINGS

MoID	Shows the Managed Object ID (MoID) of the data store that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.

SCANNING INTERVAL

- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

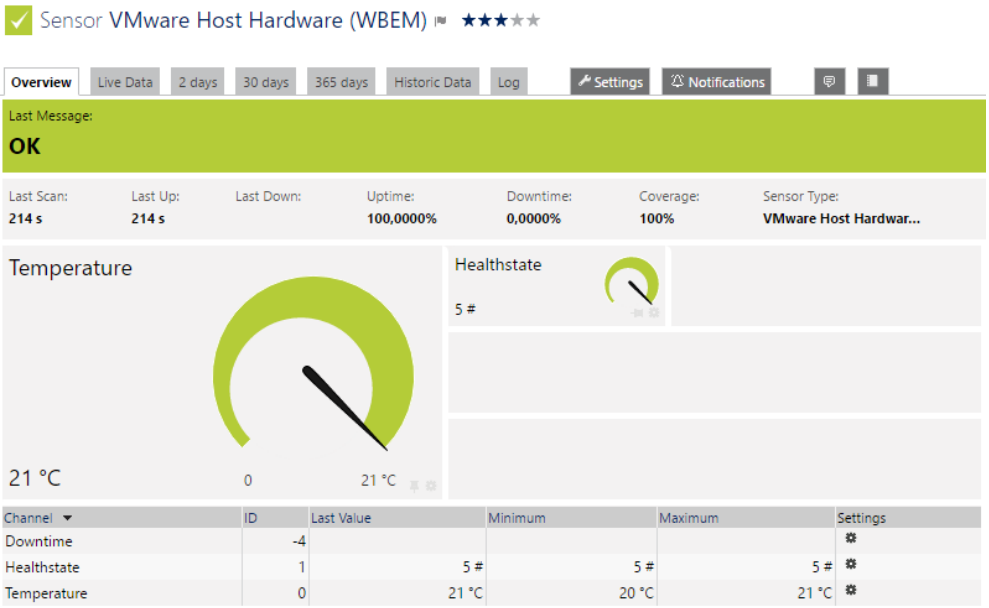
7.8.197 VMware Host Hardware (WBEM) Sensor

The VMware Host Hardware sensor monitors hardware information of an ESX/ESXi server using Web-Based Enterprise Management (WBEM).

It can show the following, depending on the selected ESX component:

- Health status
- Temperature
- Power
- Fan rotations per minute (RPM)
- Battery voltage

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



VMware Host Hardware (WBEM) Sensor

Click here to enlarge: https://media-s3.paessler.com/prtg-screenshots/vmware_host_hardware_wbem.png

Remarks

- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, or 6.0.
- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the ESX components you want to monitor. PRTG creates one sensor for each hardware element you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

ESX SERVER ELEMENTS

ESX Element	Select the hardware elements you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

ESX SERVER ELEMENTS

Element	Shows the ESX element that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Automatic Sensor State	Define if the sensor will change its status dependent on the health state reading. Choose between: ▪ **Set sensor state automatically to 'Warning' or 'Down'**: Set the sensor to a **Warning** or **Down** status when the server returns respective values. The sensor will additionally change to a **Down** status if the connection to the server fails. ▪ **Just report the current reading, ignore Server Health Value**: Never change the sensor's status dependent on the values returned by the server. The sensor will only change to a **Down** status if the connection to the server fails.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

ESX SERVER ELEMENTS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

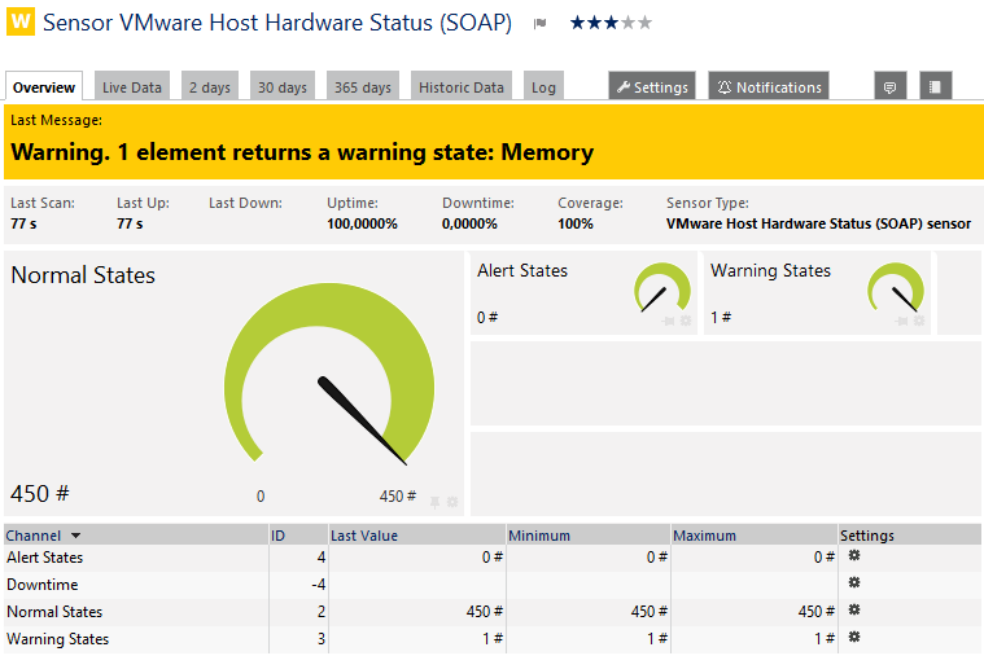
For more general information about settings, please see the **Object Settings** 188 section.

7.8.198 VMware Host Hardware Status (SOAP) Sensor

The VMware Host Hardware Status (SOAP) sensor monitors the hardware status of a VMware host server using Simple Object Access Protocol (SOAP).

- It shows the total number of items in "Normal", "Warning," and "Alert" status, just as the vSphere client reports.

This sensor is intended to give you a general status overview for your host. Any states other than "Normal" will be reported in the sensor message.



VMware Host Hardware Status (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_host_hardware_status_soap.png

Remarks

- Requires 2363 .NET 4.0 or higher to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- This sensor only shows items that report an actual status, so you might see more "sensors" in your vSphere client than the number of states available in the channels of this PRTG sensor.
- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, or 6.0. We recommend that you do not use this sensor type on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

- Knowledge Base: I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using remote probes 3196 or when running a cluster 116 setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the VMware hosts you want to monitor. PRTG creates on sensor for each host server you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VMWARE HOST SETTINGS

Host Server	Select the host server you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE HOST SETTINGS

MoID	Shows the Managed Object ID (MoID) of the host that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Known Warnings	Enter one or more semicolon (;) separated warning messages from the VMware host that you want to ignore. Messages that you enter here will not affect the sensor status. Please enter a string or leave the field empty. We strongly recommend that you use this filter for known issues only. For example, various systems (mainly HP and IBM systems) return unknown states because of errors in the the vendors' CIM extensions. Because of this, you might not get an **Up** status 163 for this sensor at all although your vSphere client does not show warnings. In this case, use this filter option and enter the known warning message(s), for example, Power Supply 7;Power Supply 8
Known Errors	Enter one or more semicolon (;) separated error messages from the VMware host that you want to ignore. Messages that you enter here will not affect the sensor status. Please enter a string or leave the field empty. We strongly recommend that you use this filter for known issues only. For example, various systems (mainly HP and IBM systems) return unknown states because of errors in the the vendors' CIM extensions. Because of this, you might not get an **Up** status 163 for this sensor at all although your vSphere client does not show errors. In this case, use this filter option and enter the known error message(s), for example, Power Supply 7;Power Supply 8

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

7.8.199 VMware Host Performance (SOAP) Sensor

The VMware Host Performance (SOAP) sensor monitors a VMware host server using Simple Object Access Protocol (SOAP).

It can show the following:

- CPU usage in percent
- CPU ready in percent
- Network usage
- Disk usage
- Disk read and write speed
- Active memory in bytes
- Consumed memory in bytes and percent
- Used memory swap
- Disk and data store latency (read and write)
- Network received and transmitted speed
- Power status

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

VMware Host Performance (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_host_performance_soap.png

Remarks

- Requires 2374 .NET 4.0 or higher to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).

- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, or 6.0. We recommend that you do not use this sensor type on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using remote probes 3196 or when running a cluster 116 setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE HOST SETTINGS

MoID	Shows the Managed Object ID (MoID) of the host that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.200 VMware Virtual Machine (SOAP) Sensor

The VMware Virtual Machine (SOAP) sensor monitors a virtual machine on a VMware host server using Simple Object Access Protocol (SOAP).

It shows the following:

- CPU usage in percent
- CPU ready in percent
- Active memory in bytes
- Consumed memory in bytes and percent
- Disk read and write speed
- Read and write latency
- Network usage (total, received, and transmitted bytes per second)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value	Minimum	Maximum	Settings
CPU ready (Percent)	10	0,63 %	0,04 %	6,865 %	
CPU usage	2	4,48 %	0 %	46,49 %	
Datastore total ReadLatency	8	0 msec	0 msec	65 msec	
Datastore total WriteLatency	3	0 msec	14 msec	473 msec	
Disk read	11	0 Mbit/s	0 Mbit/s	92 Mbit/s	
Disk usage	13	0 Mbit/s	0 Mbit/s	255 Mbit/s	
Disk write	14	0 Mbit/s	0 Mbit/s	177 Mbit/s	
Downtime	-4				
Memory active	4	184 MByte	0 MByte	6.083 MByte	
Memory consumed	5	6.011 MByte	3.327 MByte	6.012 MByte	
Memory consumed (Percent)	12	97,84 %	54,15 %	97,85 %	
Network received	7	36 KByte/s	0 KByte/s	8.314 KByte/s	
Network transmitted	6	4 KByte/s	0 KByte/s	7.990 KByte/s	
Network usage	9	41 KByte/s	0 KByte/s	16.304 KByte/s	
Power	15	2 #	1 #	18 #	

VMware Virtual Machine (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_virtual_machine_soap.png

Remarks

- Requires 2384 .NET 4.0 or higher to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- We recommend that you use vCenter as parent device. When the monitored VM changes the host server via vMotion, PRTG can continue monitoring in this case. The sensor can monitor VMware ESXi server version 5.0, 5.1, 5.5, or 6.0.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

- For VMware virtual machines, disk usage channels are only available as of virtual hardware version 8.
- Knowledge Base: I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using remote probes 3196 or when running a cluster 116 setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG requests a full list of all virtual machines configured on the device. Because of this, it may take a few seconds before the dialog is loaded.

Select the VMware virtual machines you want to monitor. PRTG creates one sensor for each virtual machine you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VIRTUAL MACHINE SETTINGS

Virtual Machine	You see a list of all virtual machines (VMs) available on the host server on this device, including the ones that are not running. All VMs are listed by name and the OS they are running on. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE VIRTUAL MACHINE SETTINGS

MoID	Shows the Managed Object ID (MoID) of the virtual machine that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Handling of "Powered Off" VM	Define how the sensor will react to a virtual machine that is powered off. Choose between: • **Ignore "powered off" state (default)**: The sensor will not change to a **Down** status 163 if the virtual machine is powered off. It will report zero values instead. • **Alarm when VM is "powered off"**: The sensor will change to a **Down** 163 status if the virtual machine is powered off. Note: While in Down status, a sensor does not record any data in any of its channels.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

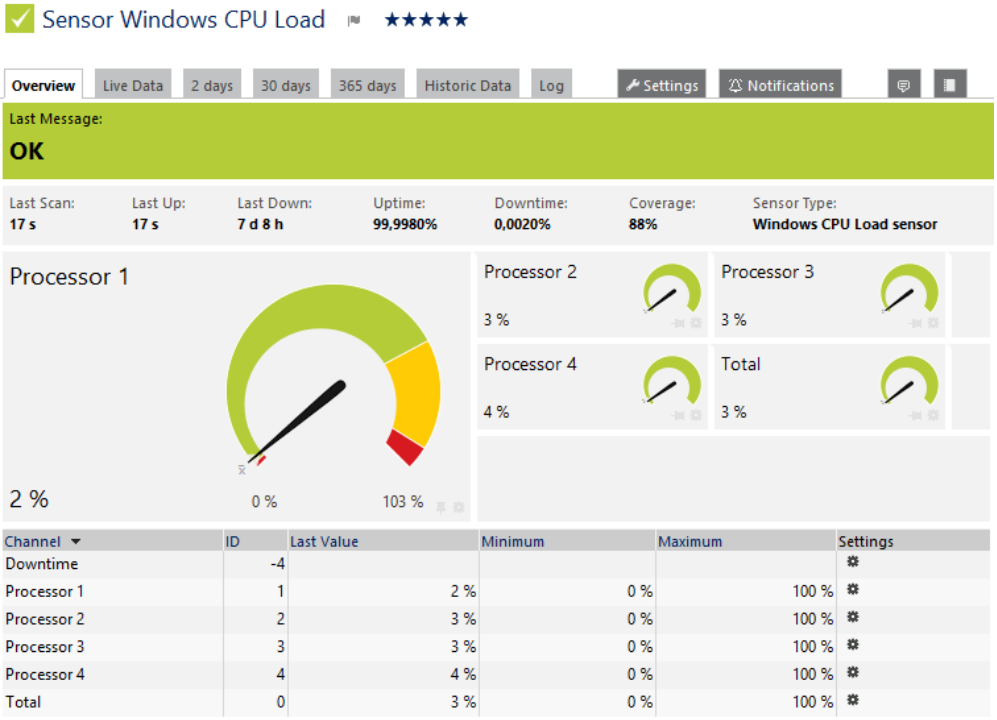
Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.201 Windows CPU Load Sensor

The Windows CPU Load sensor monitors the CPU load on a computer via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

- It shows the CPU usage of all processors and the total load in percent.



Windows CPU Load Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_cpu_load.png

Remarks

- Requires 2394 Windows credentials in the parent device settings 360.
- Requires 2394 Windows 2008 or later on the probe system.
- Requires 2394 the Windows Remote Registry service to be running on the target computer.
- Can use a hybrid approach 2394 to query monitoring data: Performance counters as standard approach and WMI as fallback.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a hybrid approach in the **Windows Compatibility Options** of the parent device's settings 372 on which you create this sensor: if you choose this option, the sensor will first try to query data via Windows Performance Counters and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3092 section.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3196.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

WMI ALTERNATIVE QUERY

Errors and Invalid Data

This is an extended help field only. PRTG's WMI sensors are equipped with the most efficient and accurate WMI queries. However, Microsoft has changed (and will continue to do so in the future) some WMI classes over the various Windows/ServicePack/ patchlevel versions, resulting in errors like "class not valid" or "invalid data". Wherever possible, PRTG features an alternative query that might work in your specific configuration. If you keep getting errors for this sensor, please try enabling the alternative query method below.

Alternative Query

Choose the method PRTG uses to query via WMI. For compatibility reasons, you can enable an alternative query method. We recommend that you use the default value. You can choose between:

- **Use default (recommended)**: Use PRTG's standard method to query WMI. This is the best setting in most cases.
- **Use alternative (if default does not work)**: Use an alternative method to query WMI. If you keep getting errors with the default setting, please try this setting.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

- https://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.202 Windows IIS 6.0 SMTP Received Sensor

The Windows IIS 6.0 SMTP Receiver Sensor monitors Microsoft's Internet Information Services regarding the number of received emails for an IIS 6.0 SMTP service (Exchange 2003) using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

- It shows the number and bytes of received messages.

Remarks

- Requires 2403 Windows credentials in the parent device settings 360.
- Requires 2404 Windows 2008 or later on the probe system.
- Requires 2404 the Windows Remote Registry service to be running on the target computer.
- Can use a hybrid approach 2403 to query monitoring data: Performance counters as standard approach and WMI as fallback.
- This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a hybrid approach in the **Windows Compatibility Options** of the parent device's settings 372 on which you create this sensor: if you choose this option, the sensor will first try to query data via Windows Performance Counters and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3092 section.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3196.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

	You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

SCANNING INTERVAL

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- https://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.203 Windows IIS 6.0 SMTP Sent Sensor

The Windows IIS 6.0 SMTP Sent Sensor monitors Microsoft's Internet Information Services regarding the number of sent emails for an IIS 6.0 SMTP service (Exchange 2003) using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It shows the following:

- Number and bytes of sent messages
- Number of retries per second for sent messages

Remarks

- Requires 2412 Windows credentials in the parent device settings 360.
- Requires 2413 Windows 2008 or later on the probe system.
- Requires 2413 the Windows Remote Registry service to be running on the target computer.
- Can use a hybrid approach 2412 to query monitoring data: Performance counters as standard approach and WMI as fallback.
- This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a hybrid approach in the **Windows Compatibility Options** of the parent device's settings 372 on which you create this sensor: if you choose this option, the sensor will first try to query data via Windows Performance Counters and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3092 section.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3196.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** [124] that this sensor inherits [124] from its parent device, group, and probe [118]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [124], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited [124] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** [3226]. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- https://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

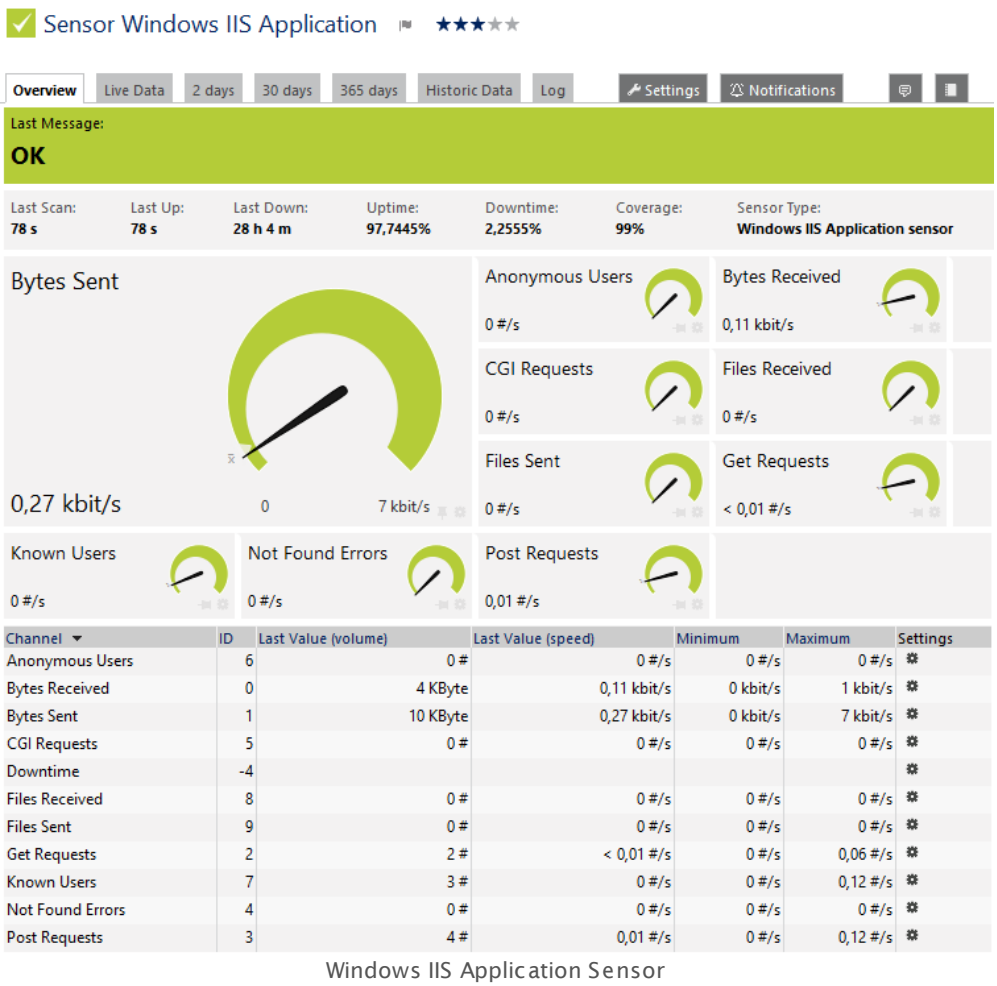
For more general information about settings, please see the **Object Settings** 188 section.

7.8.204 Windows IIS Application Sensor

The Windows IIS Application sensor monitors a Microsoft Internet Information Services server via Windows Management Instrumentation (WMI). It can also monitor applications that use IIS, such as Microsoft SharePoint or Microsoft Reporting Services (SSRS).

It shows the following:

- Sent and received bytes per second
- Number of sent and received files per second
- Number of anonymous and known users per second
- Number of Common Gateway Interface (CGI) requests per second
- Number of GET and POST requests per second
- Number of not found errors per second



Windows IIS Application Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_iis_application.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the web service instances you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI INTERNET INFORMATION SERVICES

Specify Instance	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI INTERNET INFORMATION SERVICES

Instance	Shows the name of the web service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

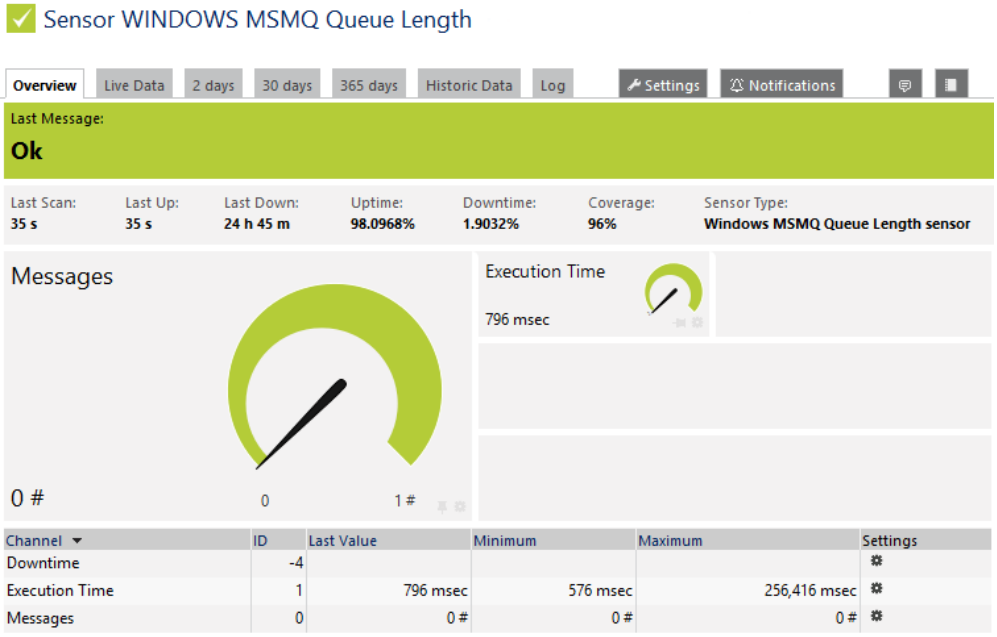
For more general information about settings, please see the **Object Settings** 188 section.

7.8.205 Windows MSMQ Queue Length Sensor

The Windows MSMQ Queue Length sensor reads the number of messages in a Microsoft Message Queue of the parent device.

It shows the following:

- Total number of messages in the queue
- Execution time



Windows MSMQ Queue Length Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_msmq_queue_length.png

Remarks

- Requires 2431 .NET 4.0 or 4.5 to be installed on the probe system.
  If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- Requires 2431 Windows credentials in the parent device settings 360.
- Requires 2431 the MSMQ service to be running on both the probe and the target system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: How do I activate Message Queuing in my Windows installation?
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Requirement: Message Queuing Service

In order for this sensor to work, the MSMQ "Message Queuing" service must be started both on the target system and on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. Additionally, the MSMQ "Message Queuing" service must also be started on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Depending on your Windows version you may first need to install the Microsoft Message Queue (MSMQ) Server.

When installing Microsoft Message Queue (MSMQ) Server, make sure you install it including the Directory Service. Depending on your Windows installation this might have a different name, such as

- MSMQ Active Directory Domain Service Integration
- Directory Service Integration
- Active Directory Integration

For details, please see **More** 2439 section below.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the message queues you want to monitor. PRTG creates one sensor for each queue you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Message Queue	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. If there are no message queues available, you will see a corresponding message. ⓘ This sensor cannot monitor sub-queues.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

ⓘ Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Message Queue	Shows the name of the queue that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Message Queue Type	Shows the type of the queue that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Min. Message Age	Optionally define an age in minutes the message has to be old to be counted. If set, messages younger than this age are not regarded. If you leave this field blank, the sensor will not check for the message age. Please enter an integer value or leave the field empty.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change.

SENSOR SETTINGS

- **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2791 whenever the sensor value changes.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.

SCANNING INTERVAL

- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2822] in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [210] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [360] or in the superior **Group Settings** [334].

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

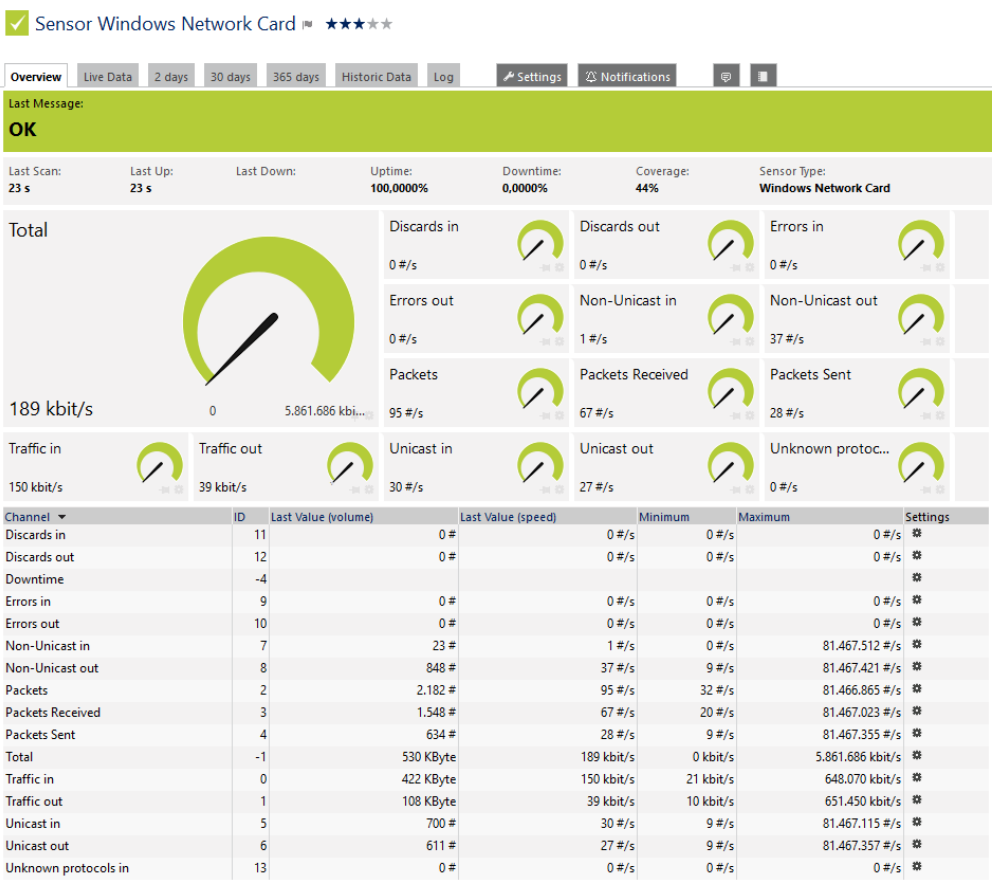
7.8.206 Windows Network Card Sensor

The Windows Network Card sensor monitors bandwidth usage and traffic of a network interface using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- Total traffic on the network card
- Traffic in and traffic out
- Number of received and sent packets
- Total number of packets
- Number of discards (in and out)
- Number of errors (in and out)
- Number of unicast packets (in and out)
- Number of non-unicast packets (in and out)
- Number of unknown protocols (in)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
Discards in	11	0 #	0 #/s	0 #/s	0 #/s	
Discards out	12	0 #	0 #/s	0 #/s	0 #/s	
Downtime	-4					
Errors in	9	0 #	0 #/s	0 #/s	0 #/s	
Errors out	10	0 #	0 #/s	0 #/s	0 #/s	
Non-Unicast in	7	23 #	1 #/s	0 #/s	81.467.512 #/s	
Non-Unicast out	8	848 #	37 #/s	9 #/s	81.467.421 #/s	
Packets	2	2.182 #	95 #/s	32 #/s	81.466.865 #/s	
Packets Received	3	1.548 #	67 #/s	20 #/s	81.467.023 #/s	
Packets Sent	4	634 #	28 #/s	9 #/s	81.467.355 #/s	
Total	-1	530 KByte	189 kbit/s	0 kbit/s	5.861.686 kbit/s	
Traffic in	0	422 KByte	150 kbit/s	21 kbit/s	648.070 kbit/s	
Traffic out	1	108 KByte	39 kbit/s	10 kbit/s	651.450 kbit/s	
Unicast in	5	700 #	30 #/s	9 #/s	81.467.115 #/s	
Unicast out	6	611 #	27 #/s	9 #/s	81.467.357 #/s	
Unknown protocols in	13	0 #	0 #/s	0 #/s	0 #/s	

Windows Network Card Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_network_card.png

Remarks

- Requires 2443 Windows credentials in the parent device settings 360.
- Requires 2443 Windows 2008 or later on the probe system to work with Windows Performance Counters.
- Requires 2443 the Windows Remote Registry service to be running on the target computer.
- Can use a hybrid approach 2443 to query monitoring data: Performance counters as standard approach and WMI as fallback.
- Requires Windows 2008 / Windows 7 or later to be able to monitor 64-bit counters of the class "Network Adapter" (virtual network interfaces). On older target systems the sensor can only monitor 32-bit counters of the class "Network Interface" (the physical interface) and will show less channels.
- This sensor type supports teamed network adapters ("NIC teaming") on Windows Server 2012.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a hybrid approach in the **Windows Compatibility Options** of the parent device's settings 372 on which you create this sensor: if you choose this option, the sensor will first try to query data via Windows Performance Counters and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3092 section.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3196.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network cards you want to monitor PRTG creates one sensor for each interface you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SPECIFIC

Network Interface	Select the network card(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Selected Interface	Shows the name of the network card that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage**. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how to show different channels for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782). Manual scaling is not possible if you choose this option. ▪ **Show in and out traffic as positive and negative area chart**: Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782). Manual scaling is not possible if you choose this option. You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the **Sensor Channels Settings** 2782).
Stack Unit	This setting is only available if you choose **Stack channels on top of each other** above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- https://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

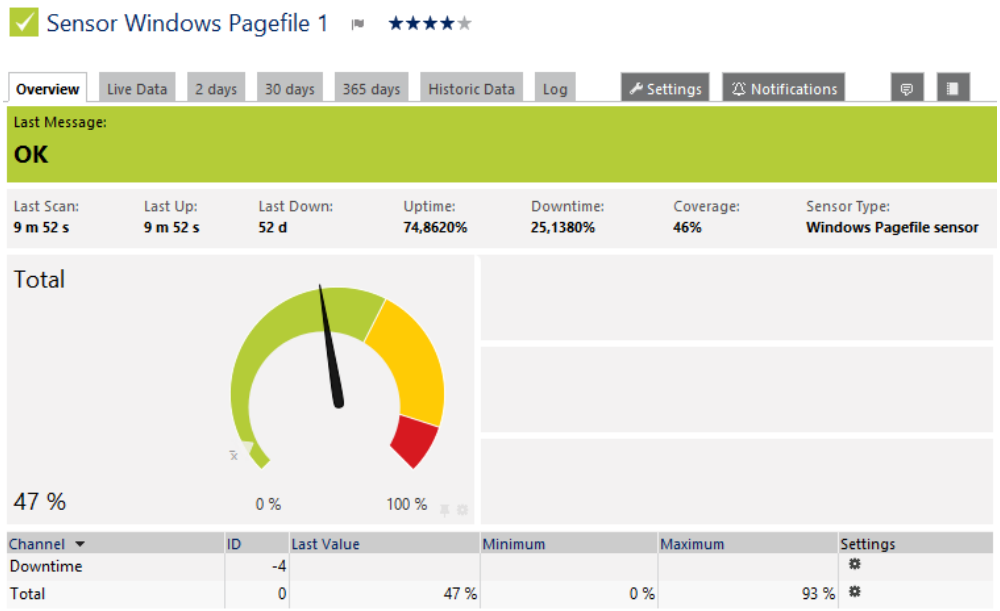
Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.207 Windows Pagefile Sensor

The Windows Pagefile sensor monitors the Windows pagefile usage via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

- It shows the pagefile usage in percent.



Windows Pagefile Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_pagefile.png

Remarks

- This sensor does not work with Windows 2000, because the respective WMI class does not exist on this operating system!
- Requires 2453 Windows credentials in the parent device settings 360.
- Requires 2453 Windows 2008 or later on the probe system.
- Requires 2453 the Windows Remote Registry service to be running on the target computer.
- Can use a hybrid approach 2453 to query monitoring data: Performance counters as standard approach and WMI as fallback.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a hybrid approach in the **Windows Compatibility Options** of the parent device's settings 372 on which you create this sensor: if you choose this option, the sensor will first try to query data via Windows Performance Counters and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3092 section.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3196.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.208 Windows Physical Disk I/O Sensor

The Windows Physical Disk I/O sensor monitors the input/output parameters of a hard disk on a Windows system via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

The sensor provides the following information:

- Disk Latency
- Disk Bandwidth
- Disk queue data
- Disk IOs

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Windows Physical Disk I/O Sensor

Click here to enlarge: https://media-s3.paessler.com/prtg-screenshots/Windows_Physical_Disk_IO.png

Remarks

- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- Requires 2463 Windows credentials in the parent device settings 360.
- Requires 2463 Windows 2008 or later on the probe system.
- Requires 2463 the Windows Remote Registry service to be running on the target computer.

- Can use a hybrid approach 2463 to query monitoring data: Performance counters as standard approach and WMI as fallback.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a hybrid approach in the **Windows Compatibility Options** of the parent device's settings 372 on which you create this sensor: if you choose this option, the sensor will first try to query data via Windows Performance Counters and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3092 section.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3196.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disk(s) you want to monitor. PRTG creates one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WINDOWS PHYSICAL DISK SPECIFIC

Physical Disk(s)	Select the disk(s) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WINDOWS PHYSICAL DISK SPECIFIC

Physical Disk(s)	Shows the disk this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226.

DEBUG OPTIONS

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

The result of this sensor is only written to disk if you use **WMI only (recommended)** as **Preferred Data Source**, as defined in the Windows Compatibility Options 372 of the parent device.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply. If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply. If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- https://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

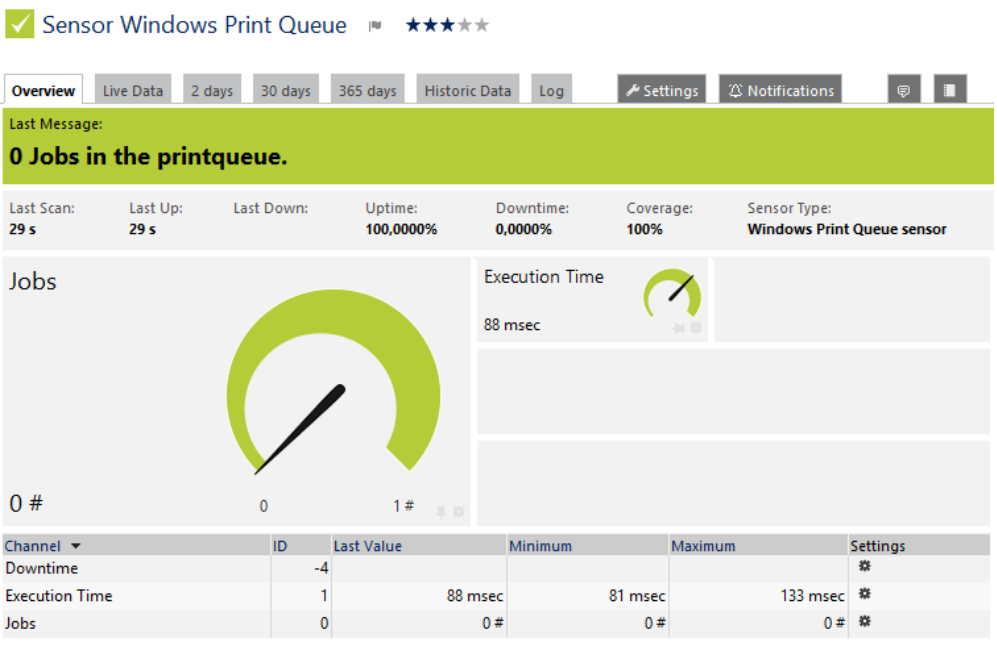
7.8.209 Windows Print Queue Sensor

The Windows Print Queue sensor reads the print queue on its parent device and returns the number of jobs in the print queue. It can monitor queues for all printers that are installed locally. For example, you can use this sensor to monitor all print queues on your Windows print server and retrieve information about all available jobs that are in the queue longer than defined.

It shows the following:

- Number of jobs in the queue
- Execution time

Additionally, this sensor can change to a defined status if there is a printer problem. See section **Sensor Settings** 2474 for available parameters.



Windows Print Queue Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_print_queue.png

Remarks

- Requires 2473 .NET 4.0 or higher to be installed on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- Requires 2473 Windows credentials in the parent device settings 360.
- Requires 2473 the Print Spooler Windows service to be running on the target device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- You can add a 'change' trigger 2921 to this sensor to get a notification when the number of jobs in the queue changes.

- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Requirement: Print Spooler Service

In order for this sensor to work, the Spooler "Print Spooler" service must be started on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the print queues you want to monitor. PRTG creates one sensor for each task you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SENSOR SETTINGS

Print Queue	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. If there are no print queues available, you see a corresponding message. If a printer name changes after you create a sensor for its queue, please add the sensor anew.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Print Queue	Shows the name of the task that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Advanced Status Option	You can optionally define specific **Sensor States** 163 for several return messages of the monitored printer. Choose between: ▪ **Hide**: Do not define sensor states for specific return messages. ▪ **Show**: If you choose this option, you can define sensor states for various messages that the monitored printer reports.
Door Open Manual Feed Required Needs User Intervention Offline Out of Memory Out of Paper Paper Jammed Paper Problem Paused Printer Error	These settings are only available if you select the advanced status option above. For each reported problem of the monitored printer, you can define the status that the sensor shows. Choose between: ▪ **Ignore**: The sensor remains in the current status if this message is reported by the printer. ▪ **Warning**: The sensor shows a **Warning** status if this message is reported by the printer. ▪ **Error**: The sensor shows a **Down** status if this message is reported by the printer.

SENSOR SETTINGS

Printer Not Available

Toner Low

Toner Out

Min. Print Job Age (Sec.)

Optionally define the age of the print job in seconds. If set, jobs younger than this value are not regarded. If you leave this field blank, the sensor will not check for the print job age. Please enter an integer value or leave the field empty.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule

Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. ⓘ To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

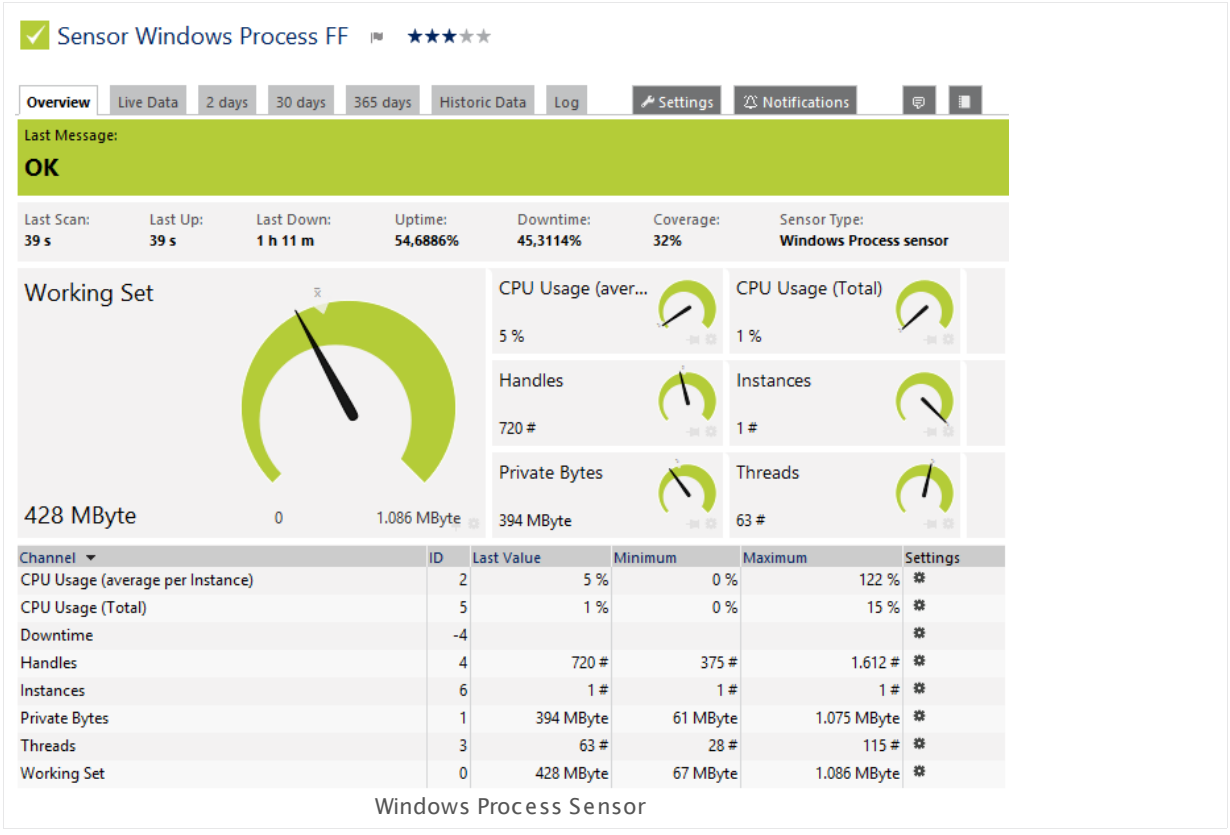
7.8.210 Windows Process Sensor

The Windows Process sensor monitors a Windows process using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

It shows the following parameters about the process:

- Absolute working set in bytes
- Private bytes
- Number of threads
- Number of handles
- Number of instances
- Average CPU usage (if there are multiple instances running)
- Total CPU usage

For the "total CPU usage" value of a process, all CPU usage values are summed up. The total is divided by the number of all CPUs and the maximum value is 100%. This corresponds to the CPU usage of all instances of this specific process. Regarding the "per instance" value, the summed up CPU usage value is divided by the number of all instances. It shows the average CPU usage of a single instance of the process on one CPU.



Windows Process Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_process.png

Remarks

- Requires 2484 Windows credentials in the parent device settings 360.
- Requires 2485 Windows 2008 or later on the probe system.
- Requires 2485 the Windows Remote Registry service to be running on the target computer.
- Does not support 64-bit processes 2484 on devices with the address "localhost", "127.0.0.1", "::1". Use the IP address in the network instead.
  This sensor cannot show values above 4 GB for 64-bit processes if you run the probe on a 64-bit Windows system. Please add this sensor to a probe running on a 32-bit Windows to monitor 64-bit processes.
- Can uss a hybrid approach 2485 to query monitoring data: Performance counters as standard approach and WMI as fallback.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Monitoring 64-bit Processes

This sensor type does not support 64-bit processes on devices with the address **localhost**, **127.0.0.1** (IPv4 address), or **::1** (IPv6 address) in PRTG. This is the case for probe devices, for example. The sensor works on all other target devices in your network. So if you want to monitor 64-bit processes on your local machine, add this device 275 to PRTG with one of the IP addresses under which it is reachable in the local network (for example, 10.0.10.20 instead of 127.0.0.1) and create the sensor on this device.

This sensor type cannot show values above 4 GB for 64-bit processes if you run the PRTG probe with this sensor on a 64-bit Windows system. The WoW64 (Windows 32-bit on Windows 64-bit) emulation layer for 32-bit applications like PRTG limits monitoring values from 64-bit systems or processes to 4 GB and caps off greater values. To avoid this issue that is caused by Windows and to correctly monitor 64-bit processes, please add this sensor to a probe that runs on a 32-bit Windows system.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a hybrid approach in the **Windows Compatibility Options** of the parent device's settings 372 on which you create this sensor: if you choose this option, the sensor will first try to query data via Windows Performance Counters and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3092 section.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3196.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WINDOWS PROCESS MONITOR

Executable	Enter the name of the process that you want to monitor. Provide the name of an executable file without the .exe extension (for example, enter firefox to monitor firefox.exe). The sensor goes into a **Down** status if the process is not active on the device.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

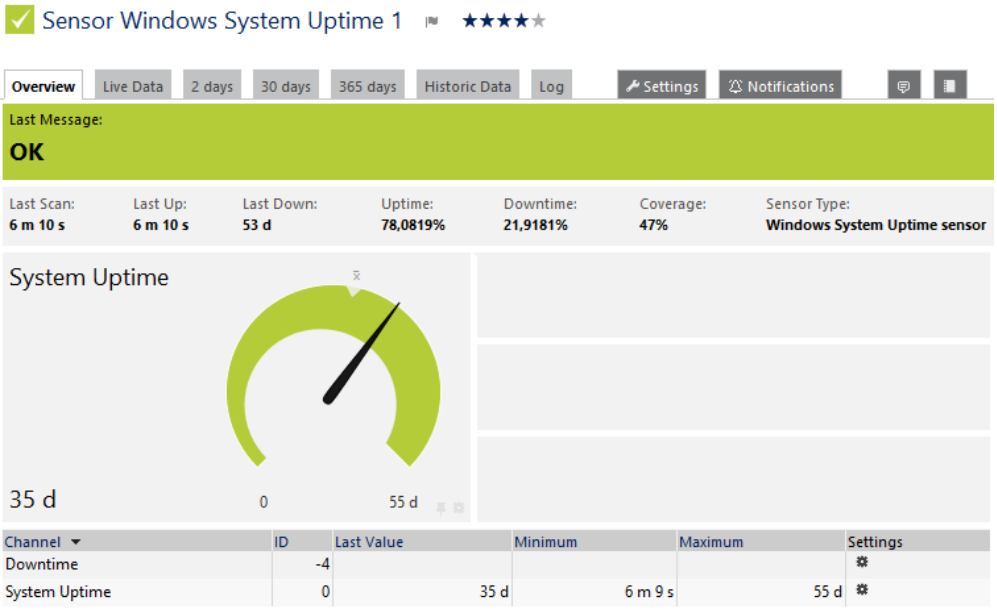
7.8.211 Windows System Uptime Sensor

The Windows System Uptime sensor monitors the uptime of a Windows system using Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device.

- It shows the total uptime of the system in days, hours, minutes.



Windows System Uptime Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_system_uptime.png

Remarks

- Requires 2493 Windows credentials in the parent device settings 360.
- Requires 2494 Windows 2008 or later on the probe system.
- Requires 2494 the Windows Remote Registry service to be running on the target computer.
- Can use a hybrid approach 2494 to query monitoring data: Performance counters as standard approach and WMI as fallback.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses Windows Management Instrumentation (WMI) to request monitoring data. You can change the default behavior to a hybrid approach in the **Windows Compatibility Options** of the parent device's settings 372 on which you create this sensor: if you choose this option, the sensor will first try to query data via Windows Performance Counters and use WMI as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3092 section.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3196.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

- https://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

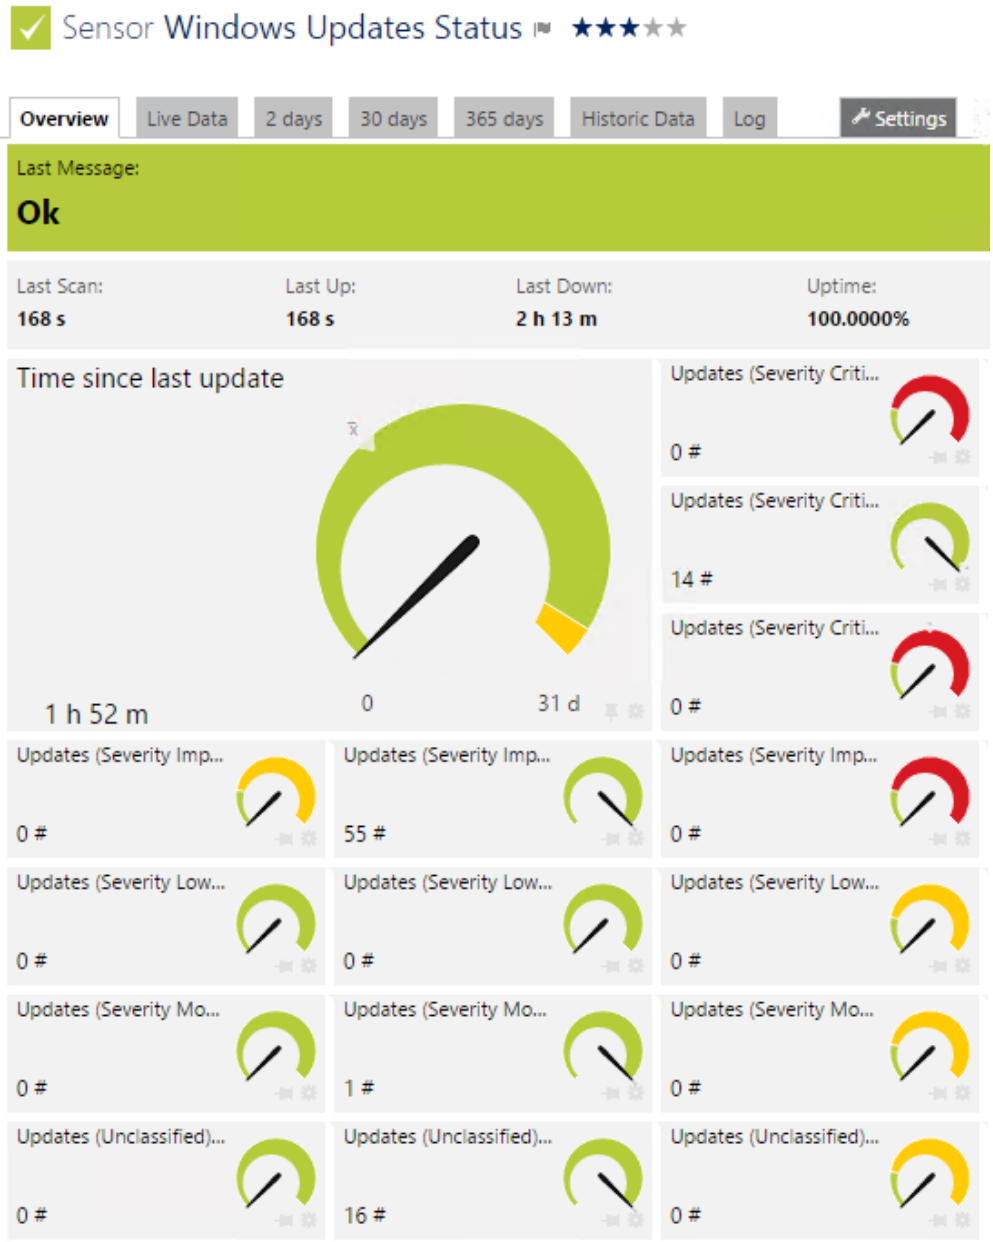
7.8.212 Windows Updates Status (Powershell) Sensor

The Windows Updates Status (Powershell) sensor monitors the status of Windows updates on a computer and counts the available and installed Windows updates—either from Microsoft or from the local Windows Server Update Services (WSUS) server.

It can show the following:

- Elapsed time since the last update
- Installed Windows updates
- Missing Windows updates
- Hidden updates
- All updates are listed with their severity.

You can find the considered updates in Server Manager (WSUS) under **Roles | Windows Server Update Services | Update Services | Computers | Reports**.



Windows Updates Status (Powershell) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_updates_status_powershell.png

Remarks

- Requires 2504 .NET 4.0 or higher to be installed on the probe system.
- Requires 2504 Remote PowerShell to be enabled on the target system and PowerShell 2.0 on the probe system.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- The minimum scanning interval for this sensor is **1 hour**.
- Knowledge Base: PowerShell Sensors: FAQ
- If the sensor cannot determine the "Time since last update" (for example, because the list of updates is empty), it will show the value **-1s** and turn into a **Warning** status 163.
- We recommend that you set the scanning interval 2507 of this sensor to at least 12 hours to limit the load on the server being monitored.
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Requirement: Remote PowerShell

The Windows Updates Status (Powershell) sensor uses PowerShell commands. To monitor devices with this sensor, **Remote PowerShell** access has to be enabled on the target computer. Also ensure that you have installed **PowerShell 2.0** or later on your probe machine.

In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For detailed information, please see **More** 1000 section below.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Port	Enter the number of the port to which this sensor connects. Please enter an integer value. The default port is **5985**.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between:

DEBUG OPTIONS

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2955 are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices**	**Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

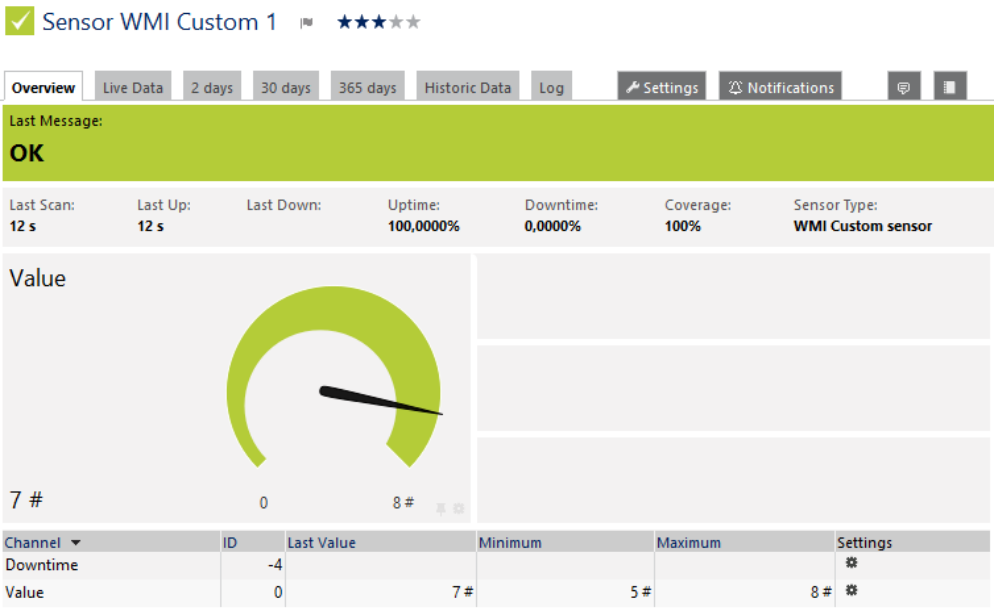
7.8.213 WMI Custom Sensor

The WMI Custom Sensor performs a custom query via Windows Management Instrumentation (WMI).

- It shows the retrieved value.

Your Windows Management Instrumentation Query Language (WQL) query code must be stored in a file on the system of the probe the sensor is created on. If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.

Save the file with the query into the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. See the section **Data Storage** [3226] for more information about how to find this path.



WMI Custom Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_custom.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe [111]. Above this number, please consider using multiple **Remote Probes** [3196] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** [3092].

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

CUSTOM QUERY SPECIFIC

Channel Name	Enter a name for the channel in which PRTG shows the received data. This name will be displayed in graphs and tables. Please enter a string. You can change the name later in the sensor's channel settings 2782.
WQL File	Select a file from the list that this sensor will use. The sensor executes it with every scanning interval. The menu contains WQL scripts from the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. Please store your script there. If used on a remote probe, you must store the file on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node. For more information on how to find this path, please see **Data Storage** 3226 section. Your query must return an integer or float value. Strings are not supported!

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CUSTOM QUERY SPECIFIC

Namespace	Enter the namespace for the query.
WQL File	Shows the WQL file that this sensor executes with every scanning interval. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Placeholder <#PH1>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Please enter a string for variable **<#PH1>** or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Please enter a string for variable **<#PH2>** or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Please enter a string for variable **<#PH3>** or leave the field empty.

CUSTOM QUERY SPECIFIC

If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2791 whenever the sensor value changes.
Unit String	Enter a unit for the data that the sensor receives from your script. This is for displaying purposes only. The unit will be displayed in graphs and tables. Please enter a string.
Multiplication	Define a multiplier for the received values. By default, this is set to **1** in order to not change received values. Please enter an integer value.
Division	Define a divisor for the received values. By default, this is set to **1** in order to not change received values. Please enter an integer value.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

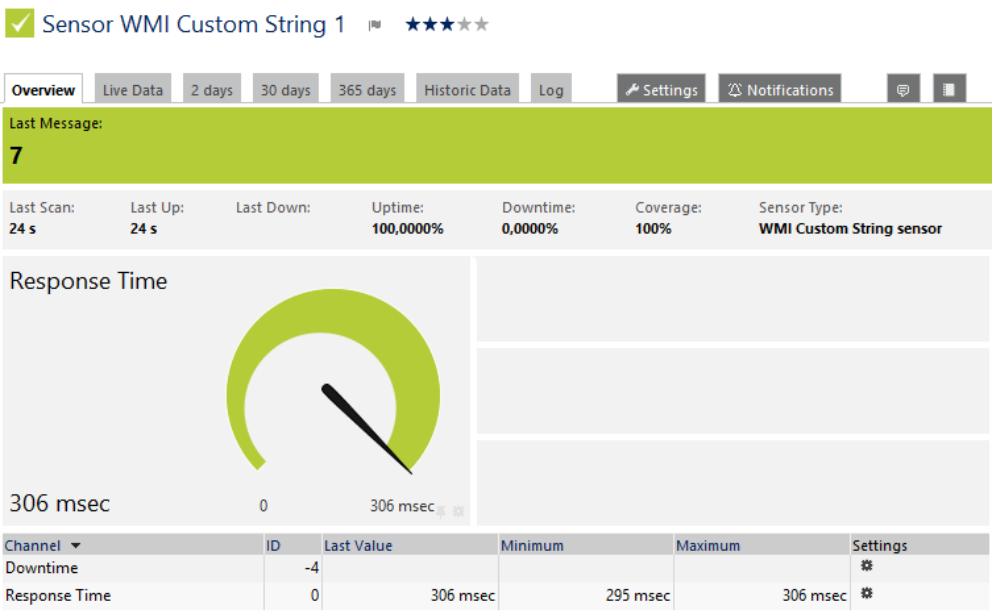
For more general information about settings, please see the **Object Settings** 188 section.

7.8.214 WMI Custom String Sensor

The WMI Custom String sensor performs a custom string query via Windows Management Instrumentation (WMI).

- It shows the retrieved string value in the sensor message.
- It also shows the response time.

Your Windows Management Instrumentation Query Language (WQL) query code must be stored in a file on the system of the probe the sensor is created on. If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.



WMI Custom String Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_custom_string.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

CUSTOM QUERY SPECIFIC

Channel Name	Enter a name for the channel in which the received data will be presented. The name will be displayed in graphs and tables. Please enter a string. You can change the name later in the sensor's channel settings 2782.
WQL File	Select a file that will be used for this sensor from the dropdown menu. It will be executed with every scanning interval. The menu contains WQL scripts from the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. Please store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node! For more information on how to find this path, please see **Data Storage** 3226 section.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CUSTOM QUERY SPECIFIC

Namespace	Enter the namespace for the query.
WQL File	Shows the name of the file that this sensor uses. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Placeholder <#PH1>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Please enter a string for variable **<#PH1>** or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Please enter a string for variable **<#PH2>** or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders that you can assign a value to in this field. Please enter a string for variable **<#PH3>** or leave the field empty.
Unit String	Enter a unit for the data that will be received by your script. This is for displaying purposes only. The unit will be displayed in graphs and tables. Please enter a string.

CUSTOM QUERY SPECIFIC

If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2791 whenever the sensor value changes.
Response Must Include	Define which string must be part of the data that is received form the WMI object. You can either enter plain text or a **Regular Expression** 3193. If the data does not include the search pattern, the sensor will be set to an error state. Please enter a string or leave the field empty.
Response Must Not Include	Define which string must not be part of the data that is received form the WMI object. You can either enter plain text or a **Regular Expression** 3193. If the data does include the search pattern, the sensor will be set to an error state. Please enter a string or leave the field empty.
For Keyword Search Use	Define the format of the search expression you entered above. ▪ **Plain Text**: Search for the string as plain text. The characters * and ? work here as placeholders, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. ▪ **Regular Expression**: Treat the search pattern as a **Regular Expression** 3193.
Maximum Length of String	Define the maximum allowed length of the string that will be received from the WMI object. If it is longer than this value, the sensor will be set to an error status. Please enter an integer value or leave the field empty.
Extract Number Using Regular Expression	Define if you want to filter out a numeric value from the string received from the WMI object. You can convert this into a float value, in order to use it with channel limits (see **Sensor Channels Settings** 2782). ▪ **No extraction**: Do not extract a float value. Use the result as a string value.

CUSTOM QUERY SPECIFIC

	▪ **Extract a numeric value using a regular expression**: Use a regular expression to identify a numeric value in the string and convert it to a float value. Define below. See also the example 2531 below.
Regular Expression	This setting is only visible if number extraction is enabled above. Enter a **Regular Expression** 3193 to identify the numeric value you want to extract from the string returned by the WMI object. You can use capturing groups here. Make sure the expression returns numbers only (including decimal and thousands separators). The result will be further refined by the settings below.
Index of Capturing Group	This setting is only visible if number extraction is enabled above. If your regular expression uses capturing groups, specify which one will be used to capture the number. Please enter an integer value or leave the field empty.
Decimal Separator	This setting is only visible if number extraction is enabled above. Define which character to use as decimal separator for the number extracted above. Please enter a string or leave the field empty.
Thousands Separator	This setting is only visible if number extraction is enabled above. Define which character to use as thousands separator for the number extracted above. Please enter a string or leave the field empty.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Example: Number Extraction with Regular Expression

If you want to extract a number in the response string using a regular expression, please note that the index for captures in this sensor is based on 1 (**not on 0**). Furthermore, capturing groups are not created automatically. The example below will illustrate this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number 3.555, i.e., the percentage in the second parentheses. Then enter the following regex in the **Regular Expression** field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As **Index of Capturing Group** enter 3. This will extract the desired number 3.555.

The index has to be 3 in this case because the capturing groups here are the following:

- Group 1 contains "3.49%), 1 Min (3.555), 5 Min (3.90"

- Group 2 contains "3.49"
- Group 3 contains "3.555"
- Group 4 contains "3.90"

Please keep in mind this note about index and capturing groups when using number extraction.

It is not possible to match an empty string with the PRTG regex sensor search.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

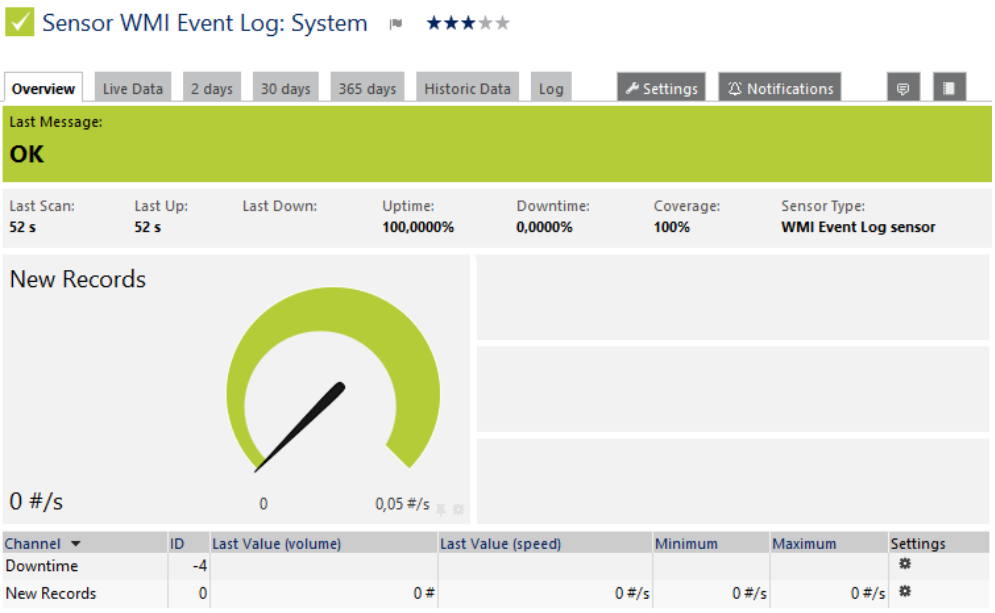
For more general information about settings, please see the **Object Settings** 188 section.

7.8.215 WMI Event Log Sensor

The WMI Event Log sensor monitors a specific Windows logfile using Windows Management Instrumentation (WMI).

- It shows the number of new records per second.

You can set the sensor to a desired status individually according to a new event log entry. For details and how to find out the correct filter, see section **More** 2542.



WMI Event Log Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_event_log.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.
- Knowledge Base: My Event Log sensor ignores changes in the event log. What can I do?
- Knowledge Base: How can I configure sensors using speed limits to keep the status for more than one interval?
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the log files you want to monitor. PRTG creates one sensor for each log you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI EVENT LOG MONITOR

Log File	The Windows event log provides several different logfiles. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI EVENT LOG MONITOR

Log File	Shows the Windows logfile that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

FILTER EVENT LOG ENTRIES

Event Type	Specify the type of event that this sensor processes. Other event types cannot be processed. Choose between the following event types: ▪ **Any** ▪ **Error** ▪ **Warning** ▪ **Information** ▪ **Security Audit Success** ▪ **Security Audit Failure**
Filter by Source	Filter all received events for a certain event source. If you enable this option, this sensor only processes messages that match the defined value. Choose between: • **Off**: Do not filter by event source. • **On**: Enable filtering by event source.
Match String (Event Source)	This field is only visible if you enable source filtering above. Enter the source that the events come from. Only events from a source matching this string are regarded, other events are ignored. Please enter a string.
Filter by ID	Filter all received events for a certain event ID. If you enable this option, this sensor processes only messages that match the defined value(s). Choose between: • **Off**: Do not filter by event ID. • **On**: Enable filtering by event ID.
Match Values (Event ID)	This field is only visible if you enable ID filtering above. Enter an event ID that the events must have. Only events with an ID that matches this value are regarded. The Event Log (Windows API) Sensor 677 supports more than one event ID. Using this sensor type, you can enter a comma separated list of event IDs to filter for more than one ID. The WMI Event Log Sensor 2533 supports filtering for only one ID.
Filter by Category	Filter all received events for a certain event category. If you enable this option, this sensor only processes messages that match the defined value. Choose between: • **Off**: Do not filter by event category.

FILTER EVENT LOG ENTRIES

	• **On**: Enable filtering by event category.
Match String (Event Category)	This field is only visible if you enable category filtering above. Enter a category that the events must have. Only events with a category that matches this string are regarded. Please enter a string.
Filter by User	Filter all received events for a certain event user. If you enable this option, this sensor only processes messages that match the defined value. Choose between: • **Off**: Do not filter by event user. • **On**: Enable filtering by event user.
Match String (Event User)	This field is only visible if you enable user filtering above. Enter a username that the events must to be assigned to. Only events with a username that matches this string are regarded. Please enter a string.
Filter by Computer	Filter all received events for a certain event computer. If you enable this option, this sensor only processes messages that match the defined value. Choose between: • **Off**: Do not filter by event computer. • **On**: Enable filtering by event computer.
Match String (Event Computer)	This field is only visible if you enable computer filtering above. Enter a computer name that the events must be assigned to. Only events with a computer name that matches this string are regarded. Please enter a string.
Filter by Message	Filter all received events for a certain event message. If you enable this option, this sensor only processes messages that match the defined value. Choose between: • **Off**: Do not filter by event message. • **On**: Enable filtering by event message.
Match String (Event Message)	This field is only visible if you enable message filtering above. Enter a message that the event must contain. Only events with a message matching this string are regarded. Please enter a string.

For the **WMI Event Log Sensor**, you can use the percent sign (%) as placeholder for any or no character (as known from the asterisk sign (*) in Windows search) in combination with a substring. For example, you can enter **%RAS%** for any event source containing the string **RAS**.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

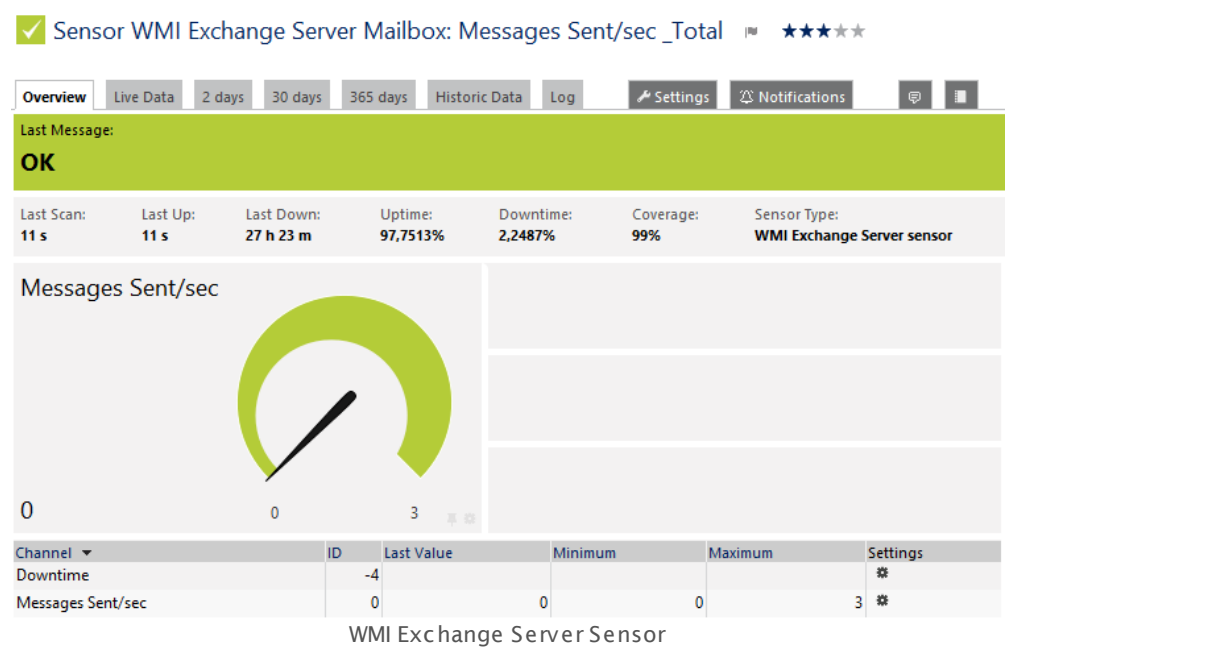
7.8.216 WMI Exchange Server Sensor

The WMI Exchange Server sensor monitors a Microsoft Exchange Server 2003, 2007, 2010, or 2013 using Windows Management Instrumentation (WMI).

It can show the following:

- Queue size
- Average delivery time
- Logon operations per second
- Sent, delivered, and submitted messages per second
- Messages queued for submission
- Remote Procedure Call (RPC) packets operations per second
- RPC latency, requests, and slow packets
- RPC sent, slow, outstanding, and failed requests (store interface)
- Read and write bytes RPC clients per second
- Number of active and anonymous users
- Database page faults per second
- Log record stalls per second
- Log threads waiting
- Database cache size in bytes and miss in percent
- Current unique users (OWA)
- Average response time (OWA)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



WMI Exchange Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_exchange_server.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

Existing former "WMI Exchange Server 2003/2007 Sensors" from previous PRTG versions will continue to monitor your Exchange server in PRTG 9, but newly added Exchange server sensors will be of the "WMI Exchange Server Sensor" type, which is able to monitor Exchange servers regardless of their version.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters of the Exchange server you want to monitor. PRTG creates one sensor for each performance counter you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

EXCHANGE SERVER DATA READINGS ACCESSIBLE USING WMI

Performance Counter

You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

The available options depend on your Exchange server configuration. PRTG shows all possible performance counters with name and instance description (if available).

You might be able to select aspects regarding:

- **SMTP Server**: Queue Lengths
- **MSExchangeIS Mailbox**: Queue Sizes, Delivery Times, Operations, Messages
- **MSExchangeIS Public**: Queue Sizes, Delivery Times, Operations, Messages
- **MSExchangeIS**: Packets, Operations, Clients, Latency, Requests, Users
- **MS Exchange RPC Client Access**: Active User Count, User Count, Connection Count
- **MS Exchange OWA**: Current Unique Users, Average Response Time

Depending on your Exchange server version, not all counters might be available.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name Instance	These fields show the parameters that are used to query data for this sensor from the target device.Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	Define what PRTG will do with the sensor results. Choose between:

READINGS ACCESSIBLE USING WMI

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

7.8.217 WMI Exchange Transport Queue Sensor

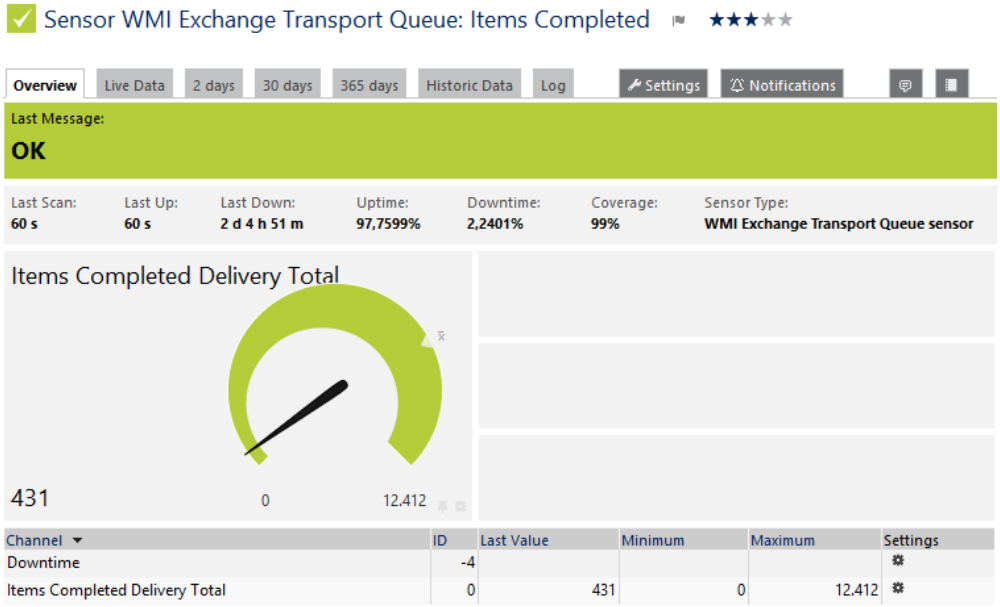
The WMI Exchange Server sensor monitors the length of transport queues of a Microsoft Exchange Server 2003, 2007, 2010, or 2013 using Windows Management Instrumentation (WMI). It shows the same information as shown in Windows System Monitor ('perfmon'). See section **More** 2563 below for an explanation of the transport queue types.

This sensor can show the following:

- Active Mailbox Delivery Queue Length
- Active Non-Smtp Delivery Queue Length
- Active Remote Delivery Queue Length
- Aggregate Delivery Queue Length (All Queues)
- Aggregate Shadow Queue Length
- Categorizer Job Availability
- Items Completed Delivery Per Second
- Items Completed Delivery Total
- Items Deleted By Admin Total
- Items Queued For Delivery Expired Total
- Items Queued for Delivery Per Second
- Items Queued For Delivery Total
- Items Resubmitted Total
- Largest Delivery Queue Length
- Messages Completed Delivery Per Second
- Messages Completed Delivery Total
- Messages Completing Categorization
- Messages Deferred Due To Local Loop
- Messages Deferred during Categorization
- Messages Queued For Delivery
- Messages Queued for Delivery Per Second
- Messages Queued For Delivery Total
- Messages Submitted Per Second
- Messages Submitted Total
- Poison Queue Length
- Retry Mailbox Delivery Queue Length
- Retry Non-Smtp Delivery Queue Length
- Retry Remote Delivery Queue Length

- Shadow Queue Auto Discards Total
- Submission Queue Items Expired Total
- Submission Queue Length
- Unreachable Queue Length

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



WMI Exchange Transport Queue Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_exchange_transport_queue.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.
- Knowledge Base: Types of Transport Queues in Microsoft Exchange

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the transport queues you want to monitor. PRTG creates on sensor for each queue you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI EXCHANGE TRANSPORT QUEUE SPECIFIC

MSExchangeTransport Queues	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. The available options depend on your Exchange server configuration. PRTG shows all possible queues with names and instance descriptions (if available). For performance reasons, we recommend to only select necessary items!

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name Instance	These fields show the parameters that are used to query data for this sensor from the target device.Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	Define what PRTG will do with the sensor results. Choose between:

READINGS ACCESSIBLE USING WMI

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

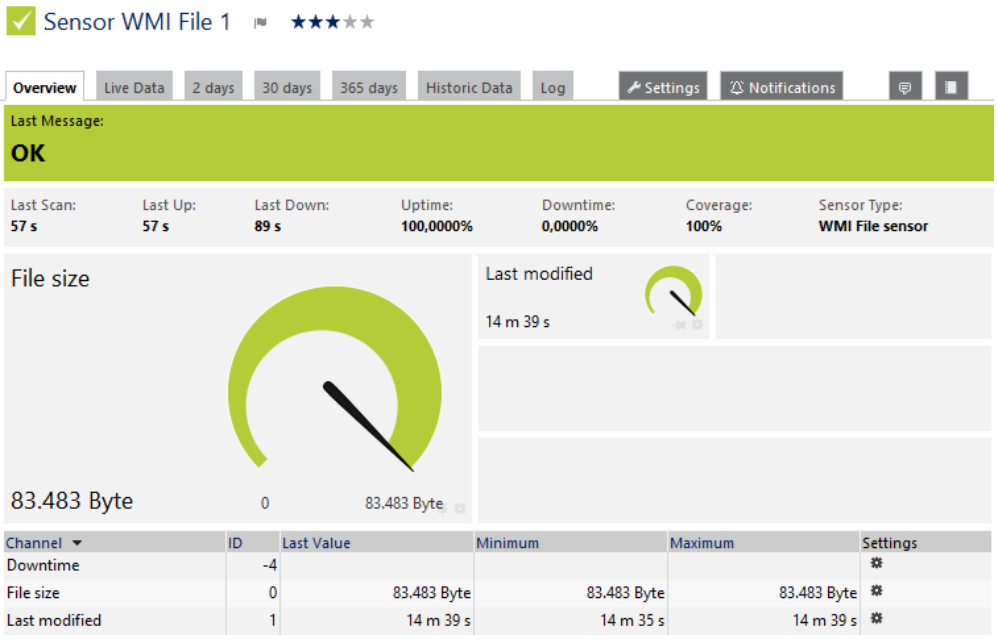
For more general information about settings, please see the **Object Settings** 188 section.

7.8.218 WMI File Sensor

The WMI File sensor monitors a file using Windows Management Instrumentation (WMI).

It shows the following:

- File size
- Elapsed time since its last modification



WMI File Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_file.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI FILE MONITOR

File Name	Enter the name of the file that this sensor checks. Enter the full local path. The file must exist on the computer your local or remote probe is running on. UNC paths are not allowed here. For example, when you create this sensor on a device under the local probe, the file has to be accessible on the local system.
If Timestamp Changes	Define what to do when the timestamp of the file changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that the timestamp has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2791 whenever the timestamp changes.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

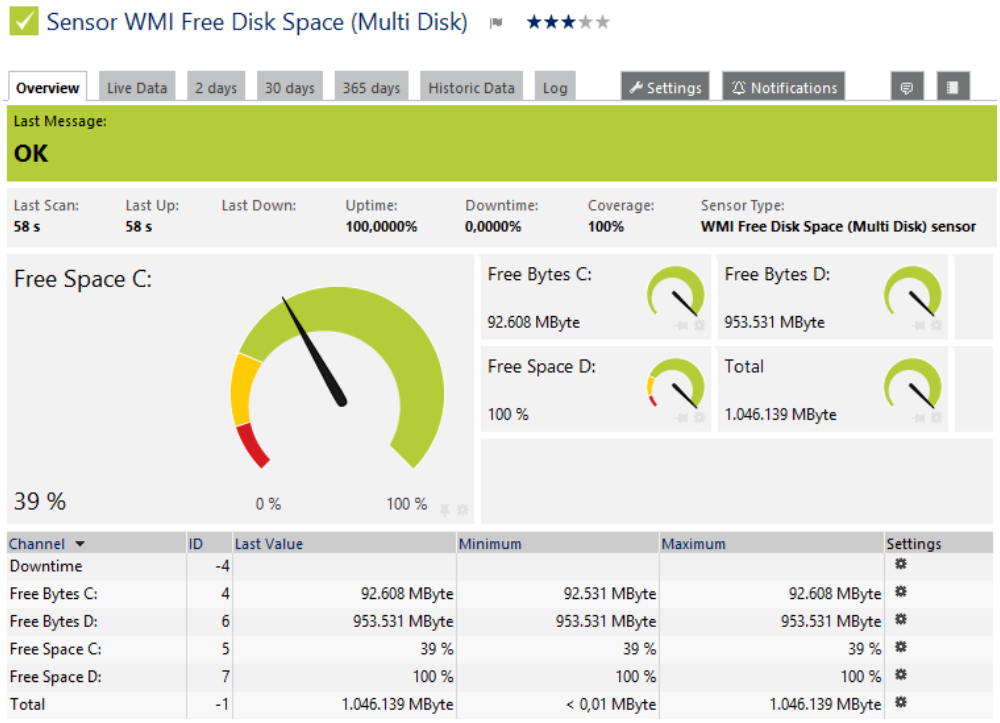
7.8.219 WMI Free Disk Space (Multi Disk) Sensor

The WMI Free Disk Space (Multi Disk) sensor monitors the free disk space of one or multiple drive(s) using Windows Management Instrumentation (WMI).

It shows the following:

- Free disk space in percent and bytes for each disk
- Disk space of a system in total

This sensor monitors logical partitions of a hard or fixed disk drive. PRTG identifies logical disks by their drive letter, such as C.



WMI Free Disk Space (Multi Disk) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_free_disk_space_multi_disk.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI DISK FREE CONFIGURATION

Drive	Select the drive(s) you want to monitor from the dropdown menu. We recommend that you use the default value. You can choose **All** to monitor all available drives, or you can choose one specific drive letter to monitor a single drive only. The data in the dropdown menu may also contain drive letters that do not exist on your device. The drive setting cannot be changed once the sensor is created.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI DISK FREE CONFIGURATION

Drive	Shows the drive(s) that this sensor monitors. This is either **All** or a specific drive letter. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SET LIMITS CHECKED AGAINST ALL DISKS

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down** status, depending on the data provided by all drives that this sensor monitors. If you want to define limits for separate channels individually, please use the limit settings in the sensor **Channel** settings.

All limits that you define here are valid in addition to the limits defined in the particular **Channels** settings! The limits are valid simultaneously, so the first limit that is breached applies.

Percentage Limit Check	Enable or disable a limit check for the free space in percentage channels of all drives. By default, percentage limits are enabled with lower warning and lower error limit. Choose between:

SET LIMITS CHECKED AGAINST ALL DISKS

- **Only use the limits in the settings of the percentage channels**: Do not define sensor limits which are valid for all percentage channels. The sensor only uses limits which you define in the settings of the particular "free space in percent" channels to determine the status.
- **Use the limits of both the sensor and the channel settings**: Define limits for the sensor which are valid for all drives (percentage channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

Upper Error Limit

This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Down** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2782. The limits set here and in the channel settings are valid simultaneously!

Upper Warning Limit

This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Warning** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2782. The limits set here and in the channel settings are valid simultaneously!

Lower Warning Limit

This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Warning** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to warning. Please enter an integer value or leave the field empty.

The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2782. The limits set here and in the channel settings are valid simultaneously!

Lower Error Limit

This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Down** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

SET LIMITS CHECKED AGAINST ALL DISKS

The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the Sensor Channels Settings 2782. The limits set here and in the channel settings are valid simultaneously!

Size Limit Check

Enable or disable a limit check for the free bytes channels of all drives. By default, byte size limits are not enabled for drives. Choose between:

- **Only use the limits in the settings of the byte size channels**: Do not define sensor limits which are valid for all byte size channels. The sensor only uses limits which you define in the settings of the particular free space in bytes channels to determine the status.
- **Use the limits of both the sensor and the channel settings**: Define limits for the sensor which are valid for all drives (byte size channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

Upper Error Limit

This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the Sensor Channels Settings 2782. The limits set here and in the channel settings are valid simultaneously!

Upper Warning Limit

This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the Sensor Channels Settings 2782. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

Lower Warning Limit	This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2782. The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2782. The limits set here and in the channel settings are valid simultaneously!
Alarm on Missing/ Removed Disk	If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between: ▪ **Deactivate alarm (default)**: Select this option if you do not want an alarm for a removed disk. ▪ **Activate alarm**: Select this option if you want to be alerted if a monitored disk is removed.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.220 WMI HDD Health Sensor

The WMI HDD Health sensor connects to the parent device via Windows Management Instrumentation (WMI) and monitors the health of IDE disk drives on the target system, using Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.). This is built into most modern IDE hard disk drives.

It can show the following, among others:

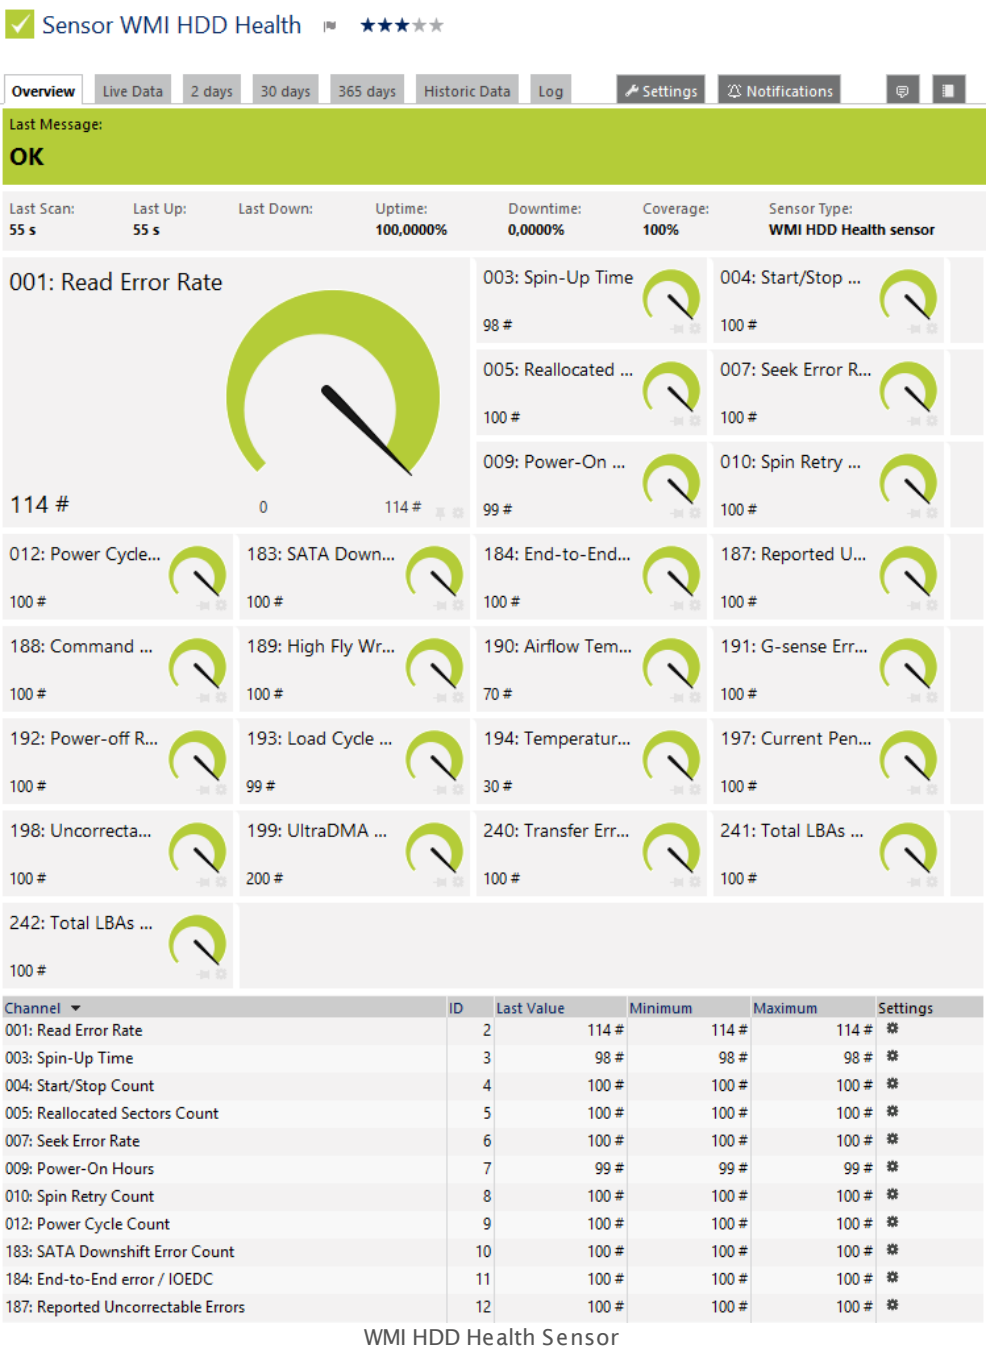
- Read Error Rate
- Spin-Up Time
- Start/Stop Count
- Reallocated Sectors Count
- Seek Error Rate
- Power-On Hours
- Spin Retry Count
- Calibration Retry Count
- Power Cycle Count
- Power-off Retract Count
- Load Cycle Count
- Temperature Celsius
- Reallocation Event Count
- Current Pending Sector Count
- Uncorrectable Sector Count
- UltraDMA CRC Error Count
- Write Error Rate
- Transfer Error Rate
- Total LBAs Written
- Total LBAs Read

Which channels the sensor actually shows might depend on the monitored device and the sensor setup. The channel names indicate the ID of the S.M.A.R.T. attribute, followed by a colon, and the typical meaning of the channel. The sensor can also show other attributes that the target device returns, but some channels will have the name **Unknown Channel**. This happens if PRTG cannot match the ID of a found attribute with an internally defined channel name.

Some vendors do not agree on attribute definitions and define meanings other than the common one.

Every attribute of a disk assumes a value. PRTG shows these attributes as channels with their last, minimum, and maximum value. These channel values change over time and indicate the disk health—higher values correspond to a better health. The disk's attributes come with a threshold, defined by the manufacturer of the drive. If a channel value is lower than this threshold, the sensor is automatically set to a **Warning** status. This indicates that the Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status of the HDD might break soon.

There are no thresholds defined for some attributes and because of this they cannot be judged for a status other than **Up**. You can **Define Lookups** and use them with affected channels to get the desired status for a return value.



WMI HDD Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_hdd_health.png

Remarks

- This sensor officially requires Windows Vista or later on the target machine that holds the hard disk drives you want to monitor. The sensor may not work reliably if the target machine runs on Windows 2003 or Windows XP. Due to a known bug in those systems, the sensor may not be able to detect available hard disk drives.

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the IDE disks you want to monitor. PRTG creates one sensor for each IDE device you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SMART SPECIFIC

IDE Devices	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. . The items shown in the list are specific to the parent device you create the sensor on.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SMART SPECIFIC

Serial No.	Shows the serial number of the monitored disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size (GB)	Shows the size of the monitored disk in gigabytes. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the monitored disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.

SCANNING INTERVAL

- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.
	Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:
	▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

(i) To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

(i) Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

7.8.221 WMI Logical Disk I/O Sensor

The WMI Logical Disk I/O sensor monitors the disk usage of a logical disk or mount point on a Windows system using Windows Management Instrumentation (WMI).

The sensor provides the following information:

- Free space
- Disk latency
- Disk bandwidth
- Disk queue data
- Disk IOs

This sensor shows performance data from counters that monitor logical partitions of a hard drive. The system monitor identifies logical disk instances by their identifier, such as C, and the sensor reads the logical disk object in the system monitor and returns the values.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

WMI Logical Disk I/O Sensor

Click here to enlarge: https://media-s3.paessler.com/prtg-screenshots/WMI_Logical_Disk_IO_Sensor.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.
- This sensor type supports Windows Server 2008 R2 or later. It will not work on previous Windows versions (Windows Server 2008 or earlier).

- Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disks and mount points you want to monitor. PRTG creates one sensor for each counter you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI LOGICAL DISK I/O SPECIFIC

Logical Disk(s)	Select the logical disks and mount points you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI LOGICAL DISK I/O SPECIFIC

Logical Disk(s)	Shows the logical disk or mount point that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

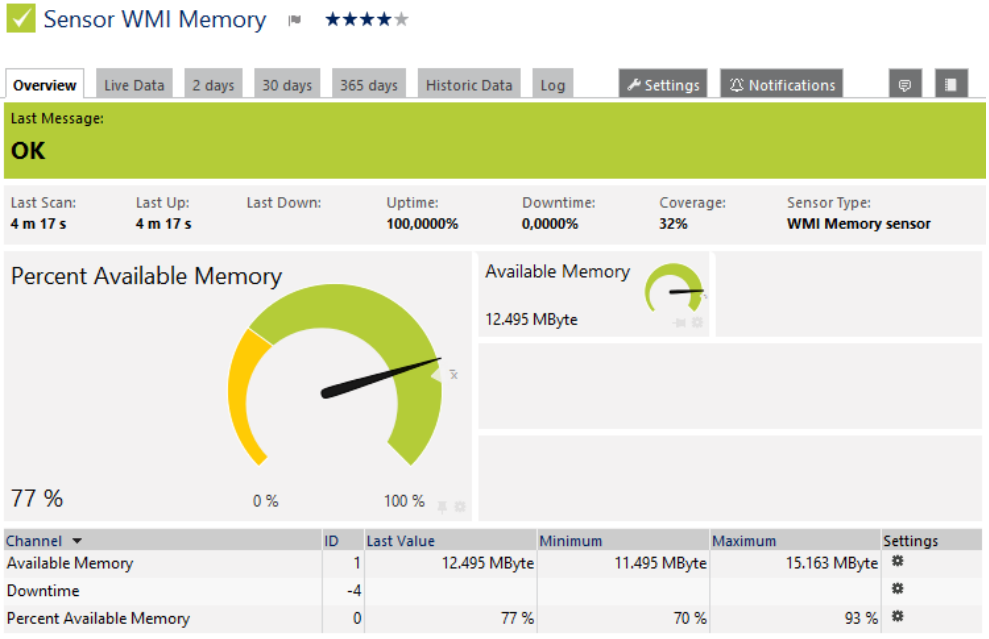
Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.222 WMI Memory Sensor

The WMI Memory sensor monitors available (free) system memory on Windows systems using Windows Management Instrumentation (WMI).

- It shows the available memory in percent and bytes.



WMI Memory Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_memory.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

WMI ALTERNATIVE QUERY

Errors and Invalid Data	This is an extended help field only. PRTG's WMI sensors are equipped with the most efficient and accurate WMI queries. However, Microsoft has changed (and will continue to do so in the future) some WMI classes over the various Windows/ServicePack/ patchlevel versions, resulting in errors like "class not valid" or "invalid data". Wherever possible, PRTG features an alternative query that might work in your specific configuration. If you keep getting errors for this sensor, please try enabling the alternative query method below.
Alternative Query	Choose the method PRTG uses to query via WMI. For compatibility reasons, you can enable an alternative query method. We recommend that you use the default value. You can choose between: • **Use default (recommended)**: Use PRTG's standard method to query WMI. This is the best setting in most cases. • **Use alternative (if default does not work)**: Use an alternative method to query WMI. If you keep getting errors with the default setting, please try this setting.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

7.8.223 WMI Microsoft SQL Server 2005 Sensor (Deprecated)

IMPORTANT NOTICE

This sensor type is deprecated.

Monitoring of Microsoft SQL Server 2005 using PRTG is discontinued. It cannot be monitored with PRTG anymore with the latest updates of SQL Server 2005. The reason for this is a software update delivered by Microsoft in August 2012. The following updates cause this issue:

- **Security Update for SQL Server 2005 Service Pack 4 (KB2716429)**
- **Security Update for SQL Server 2005 Service Pack 4 (KB2716427)**

We have made reasonable effort to fix this from our side but we were unable to. We do not have instructions to circumvent this issue at this time. Please ask the vendor to fix this.

More

Knowledge Base: Why does my WMI Microsoft SQL Server 2005 Sensor not work anymore?

- https://kb.paessler.com/en/topic/44713

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

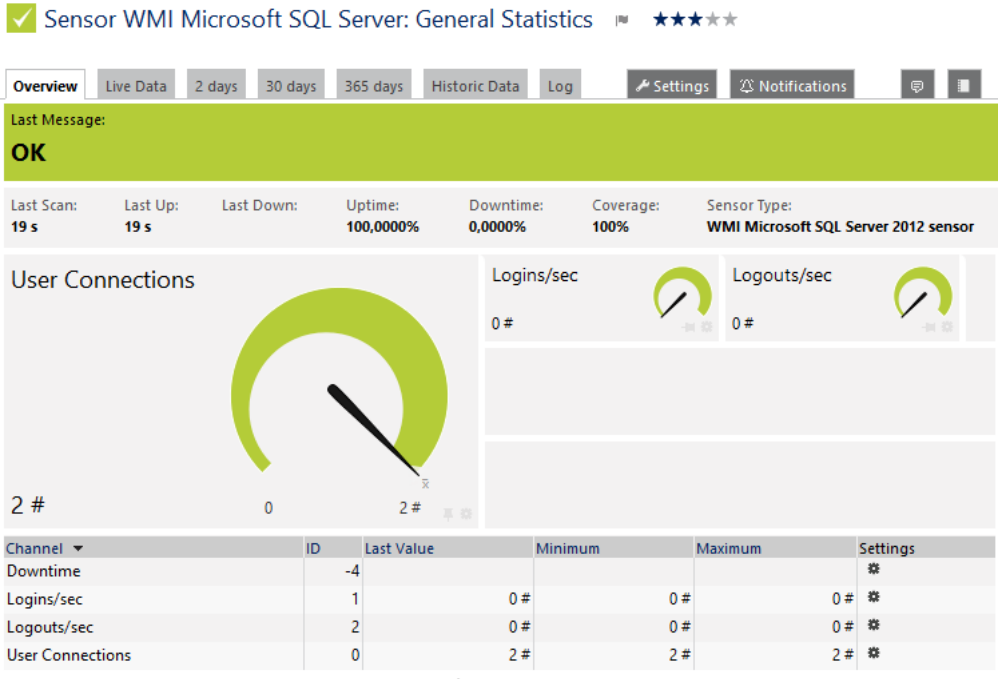
User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.

CHANNEL OVERVIEW

Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.
Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.

CHANNEL OVERVIEW

Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second.

SQL COUNTER SPECIFIC

- **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).
- **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages.
- **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).
- **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.
- **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).

Depending on your selection, PRTG creates a sensor with the specified channels.

To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

SQL SERVER SETTINGS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. ⓘ This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.

SCANNING INTERVAL

- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. ⓘ To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.224 WMI Microsoft SQL Server 2008 Sensor

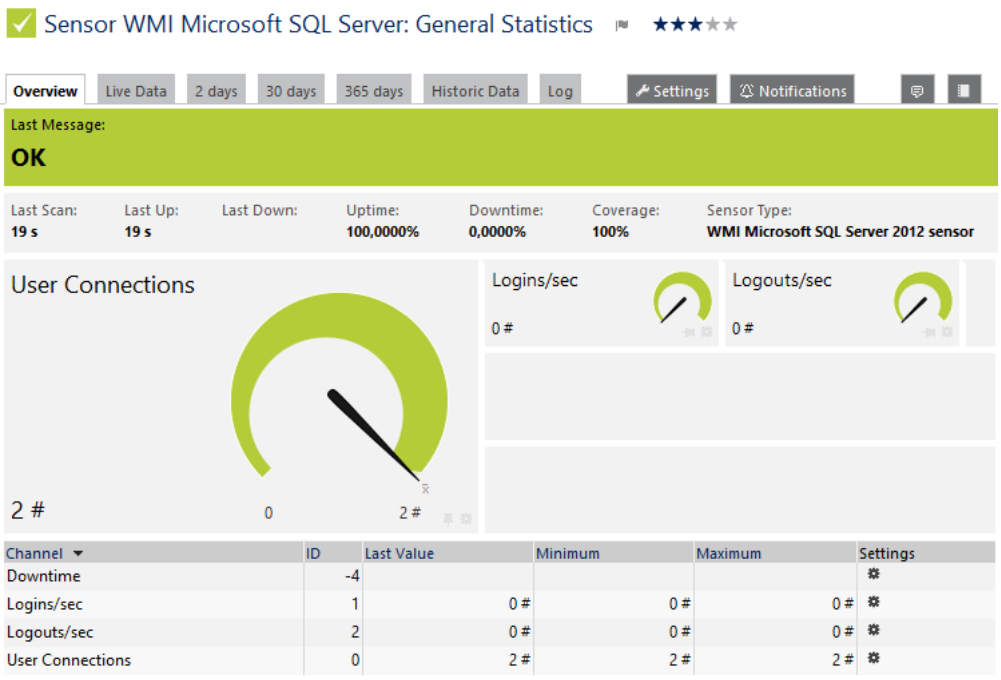
The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second. ▪ **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages. ▪ **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). Depending on your selection, PRTG creates a sensor with the specified channels.

SQL COUNTER SPECIFIC

To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply. If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply. If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.225 WMI Microsoft SQL Server 2012 Sensor

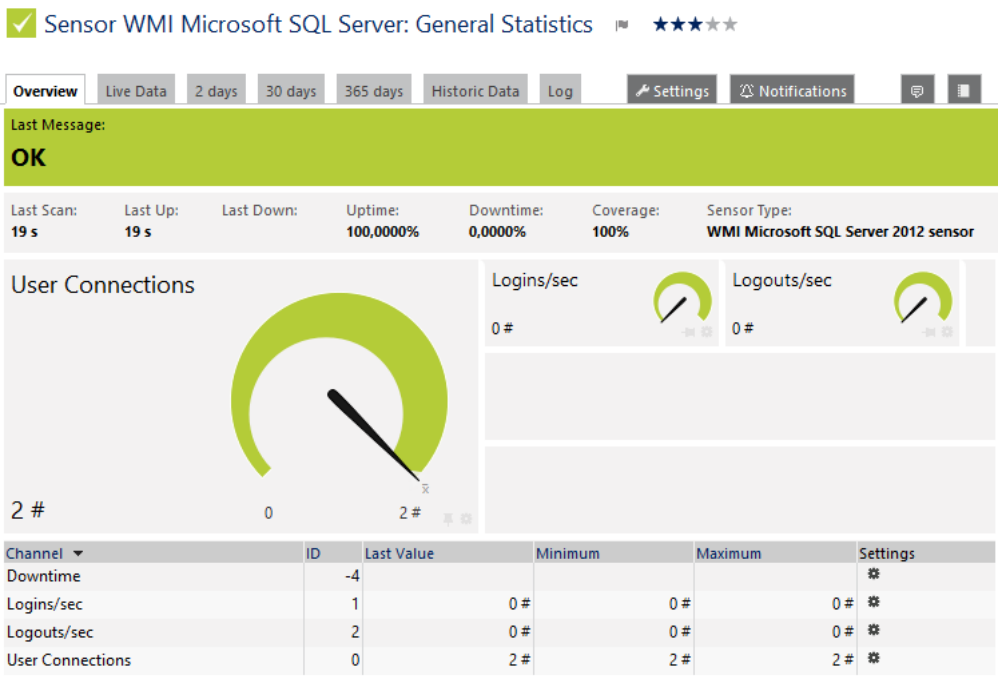
The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second. ▪ **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages. ▪ **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). Depending on your selection, PRTG creates a sensor with the specified channels.

SQL COUNTER SPECIFIC

To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply. If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply. If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.226 WMI Microsoft SQL Server 2014 Sensor

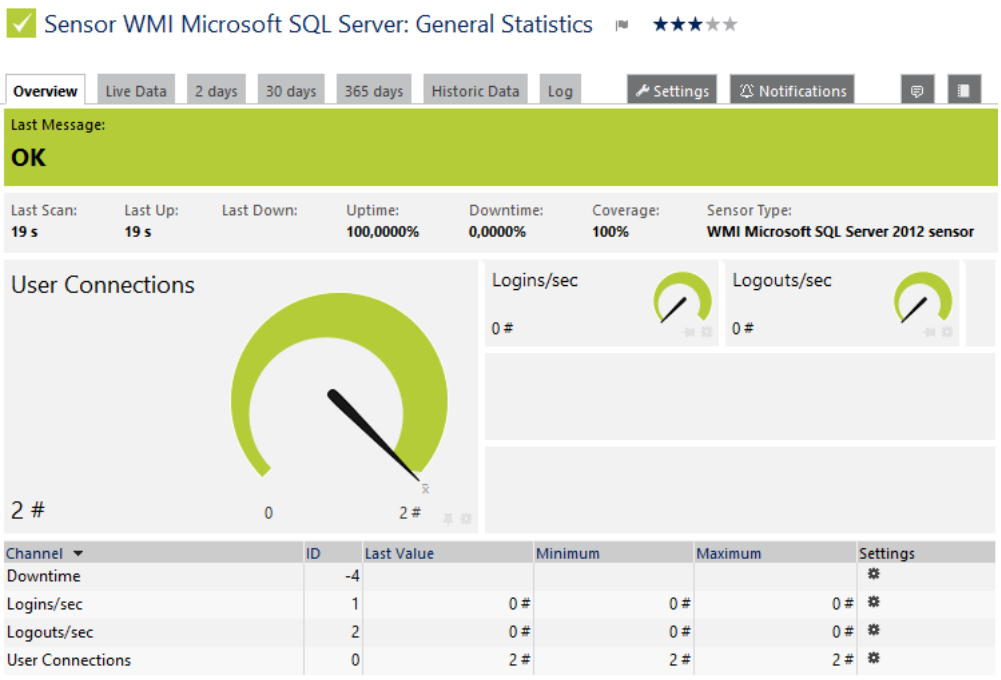
The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second. ▪ **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages. ▪ **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). Depending on your selection, PRTG creates a sensor with the specified channels.

SQL COUNTER SPECIFIC

To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply. If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply. If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.227 WMI Microsoft SQL Server 2016 Sensor

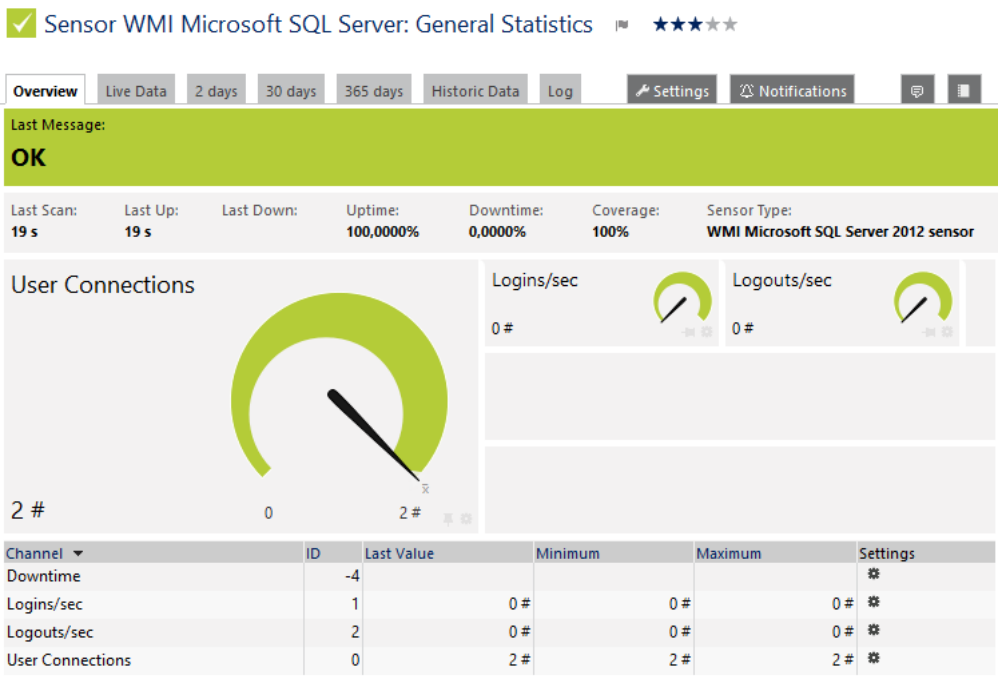
The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) that you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second. ▪ **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages. ▪ **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). Depending on your selection, PRTG creates a sensor with the specified channels.

SQL COUNTER SPECIFIC

To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section **Data Storage** 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply. If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply. If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

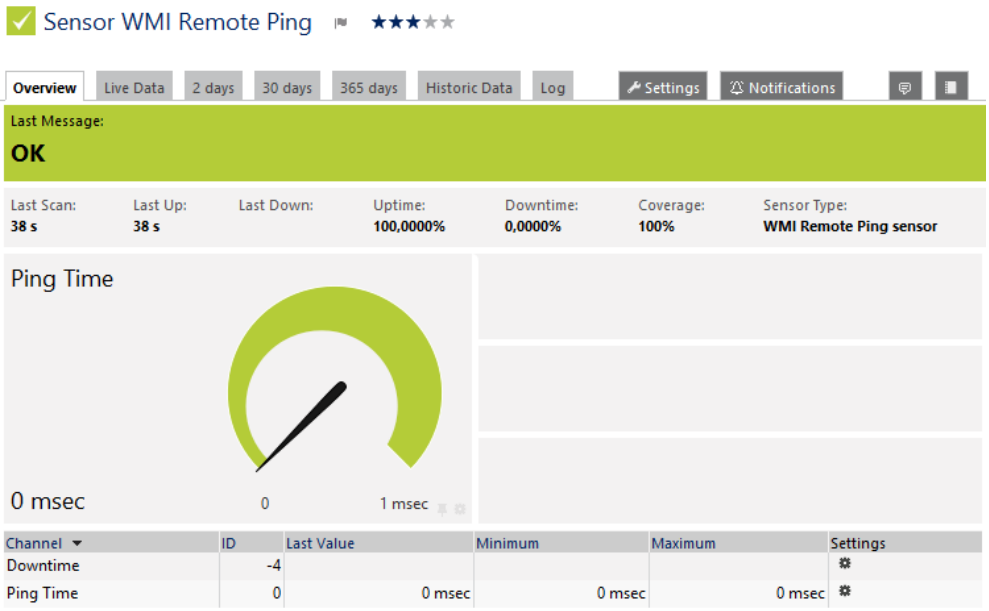
Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.228 WMI Remote Ping Sensor

The WMI Remote Ping sensor remotely connects to a Windows system using Windows Management Instrumentation (WMI), then performs an Internet Control Message Protocol (ICMP) echo request ("Ping") from this device to a specified target.

- The sensor shows the Ping time from the remote device to the target device that is being pinged.



WMI Remote Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_remote_ping.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI REMOTE PING CONFIGURATION

Target	Enter the DNS name or IP address of the target device the Ping is sent to. The sensor remotely connects to its parent device via WMI. Then it performs a Ping request from this remote device to the target device or server. Please enter a string.

WMI REMOTE PING CONFIGURATION

Timeout (Sec.)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. Please enter an integer value. The maximum timeout value is 300.
Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can choose any value between 1 and 10000. Please enter an integer value. We recommend that you use the default value.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section Data Storage 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.

SCANNING INTERVAL

- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

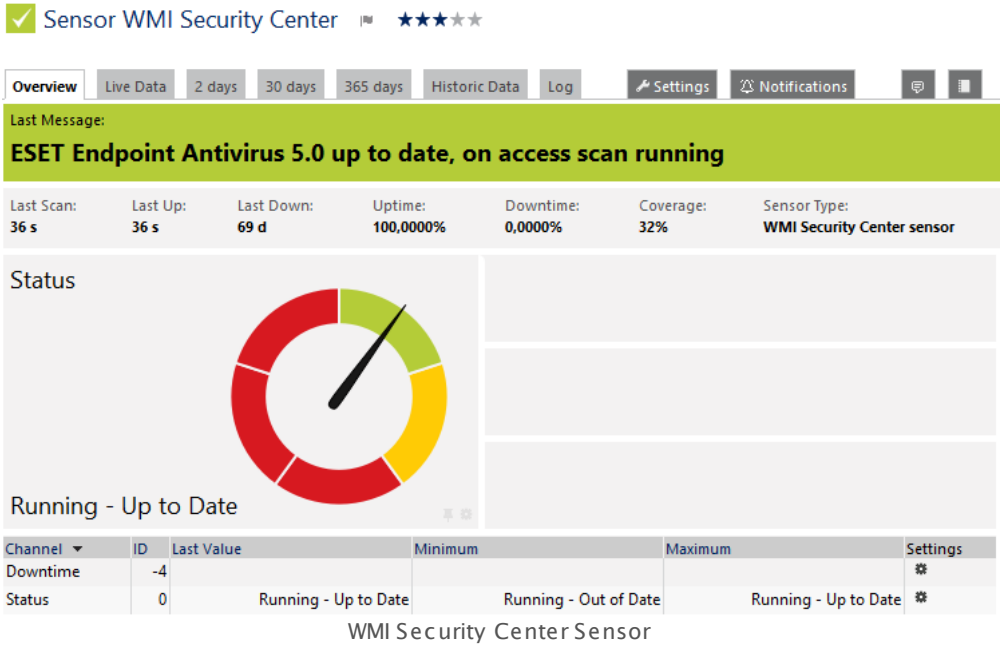
7.8.229 WMI Security Center Sensor

The WMI Security Center sensor monitors the security status of a Windows client computer using Windows Management Instrumentation (WMI). It can monitor all security products that are controlled by Windows Security Center / Windows Action Center.

- It shows the status code of the monitored product and sets the sensor status accordingly. A sensor status showing **Up** indicates that the product is up to date and the access scan is running.

Possible return values for status codes are:

Status Code	Meaning: Status of Monitored Security Product Is ...	Will Result in Sensor Status
0	Unknown	Down
1	Not running, Out of date	Down
2	Running, Out of date	Warning
3	Not running, Up to date	Down
4	Running, Up to date	OK



WMI Security Center Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_security_center.png

Remarks

- This sensor requires Windows Vista or later on the target computer.
- This sensor type does not run on Windows Server operating systems (Windows Server 2003, 2008, 2012, 2016), because the Windows Security Center / Windows Action Center is only available on client Windows versions.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3183.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the security center products you want to monitor. PRTG creates one sensor for each product you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI SECURITY CENTER SPECIFIC

Security Center Products	You see a list showing the **Name** and **Type** of all security products found in the Windows Security Center on the target device. If there are no products, you see a corresponding message. Add check marks in front of the respective lines to select the desired items. One sensor will be created for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SECURITY CENTER SPECIFIC

Display Name	Shows the name of the product monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

WMI SECURITY CENTER SPECIFIC

Type	Shows the type of the product monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, see section Data Storage 3226. You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.

SCANNING INTERVAL

- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

7.8.230 WMI Service Sensor

The WMI Service sensor monitors a Windows service using Windows Management Instrumentation (WMI).

It can show the following:

- Execution time of the monitoring request.

Additionally, if you enable **Monitor extended values** in the sensor settings, it can show these parameters:

- CPU usage in percent
- Pagefile usage in bytes
- Number of handles
- Number of threads
- Working set in bytes

The "Running (msec)" channel of this sensor shows the execution time of the monitoring request. It does not refer to the time the Windows service has been running! As of PRTG version 13, the name of this sensor channel is **Sensor Execution Time**.

WMI Service Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_service.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Windows services you want to monitor. PRTG creates one sensor for each service you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI SERVICE MONITOR

Service	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. Name and description are provided in the language of the device's Windows installation. Later on, the sensor shows a **Down** status 163 if the service is not running.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SERVICE MONITOR

If Service is Not Running	Select whether the service will be (re)started if it is stopped or paused. Choose between: ▪ **Start/Restart service**: PRTG tries to start the service if it is not running when scanning the device. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2791 whenever PRTG (re)starts the service. ▪ **Do nothing**: PRTG does not start any service on the device automatically. ⓘ If you select the start/restart option and the sensor detects that the monitored service does not run, PRTG will try to restart the service during this scan and postpones the next sensor scan for one interval. With this following scan, the sensor checks if the service runs now. If starting the service was not successful or the service failed again, the sensor will show a **Down** status 163 and not try to start the service again. If the service runs after a (re)start attempt, the sensor will continue monitoring as usual.

WMI SERVICE MONITOR

If Service is Restarted

This setting is only visible if you select **Start/Restart service** above. Define what to do if PRTG restarts the service. Choose between:

- **Ignore changes**: No action is taken on change.
- **Trigger 'change' notification**: The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2791 whenever the sensor value changes.

Monitoring

Select whether you want to monitor CPU usage and other useful performance counters. Choose between:

- **Just check if service is running**: PRTG only monitors the channel "Sensor Execution Time".
- **Monitor extended values**: PRTG also monitors other useful performance counters.

Extended monitoring might cause a "Class not found" error on some Windows systems.

Service

Shows the Windows service this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Description

Shows the description of the service. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.

  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.

SCANNING INTERVAL

If a Sensor Query Fails

Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between:

- **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request.
- **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.
- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Knowledge Base: How can I monitor a Windows service on Windows 2000?

- https://kb.paessler.com/en/topic/36483

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

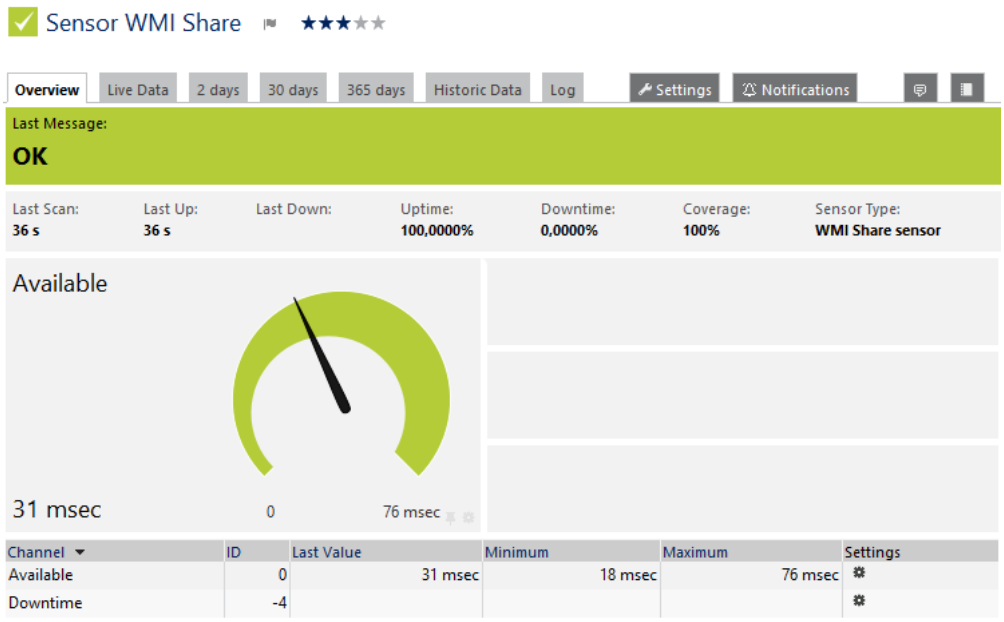
For more general information about settings, please see the **Object Settings** 188 section.

7.8.231 WMI Share Sensor

The WMI Share sensor monitors a shared resource on a Windows system using Windows Management Instrumentation (WMI).

- It shows the availability of the share.

You can define the sensor to show a **Down** status [163] for different share status messages.



WMI Share Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_share.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe [111]. Above this number, please consider using multiple **Remote Probes** [3196] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** [3092].

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the shares you want to monitor. PRTG creates one sensor for each share you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI SHARED RESOURCE

Share	Select the shares you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items. To provide any shares, the LanmanServer "Server" Windows service must be running on the target computer. If it is not, there are no shares and you see a **No Share available** message here.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** [124] that this sensor inherits [124] from its parent device, group, and probe [118]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [124], separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited [124] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SHARED RECOURCE

Shared Recource	
Description	Shows information about the shared resource that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Type	
TypeID	

TRIGGER ERROR STATE ON FOLLOWING CONDITIONS

Select under which conditions the sensor shows a **Down** status [163] from the list below. As long as the share returns OK, the sensor status is **Up**. Add a check mark symbol in front of the according line to choose a **Down** condition. Choose none, one, or several of the following conditions.

Note: While in Down status, a sensor does not record any data in any of its channels.

TRIGGER ERROR STATE ON FOLLOWING CONDITIONS

Error	Set sensor to **Down** status if the share returns an error status. A share in this status is not operational. This condition is selected by default.
Degraded	Set sensor to **Down** status if the share returns a degraded status. A share in this status is still operational. This condition is selected by default.
Unknown	Set sensor to **Down** status if the share returns an unknown status.
Pred Fail	Set sensor to **Down** status if the share returns a "predicted fail" status. This indicates that an element works properly but predicts a failure (for example, a SMART-enabled hard drive). A share in this status is still operational. This condition is selected by default.
Starting	Set sensor to **Down** status if the share returns a starting status. A share in this status is not operational.
Stopping	Set sensor to **Down** status if the share returns a stopping status. A share in this status is not operational.
Service	Set sensor to **Down** status if the share returns a service status. This can apply during disk mirror-resilvering, reloading a user permissions list, or other administrative work on the monitored device. Not all such work is online, but the managed element is neither OK nor in one of the other states. A share in this status is not operational.
Stressed	Set sensor to **Down** status if the share returns a stressed status.
Nonrecover	Set sensor to **Down** status if the share returns a "non recover" status. This condition is selected by default.
NoContact	Set sensor to **Down** status if the share returns a "no contact" status. This condition is selected by default.
LostComm	Set sensor to **Down** status if the share returns "lost communication" status. This condition is selected by default.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

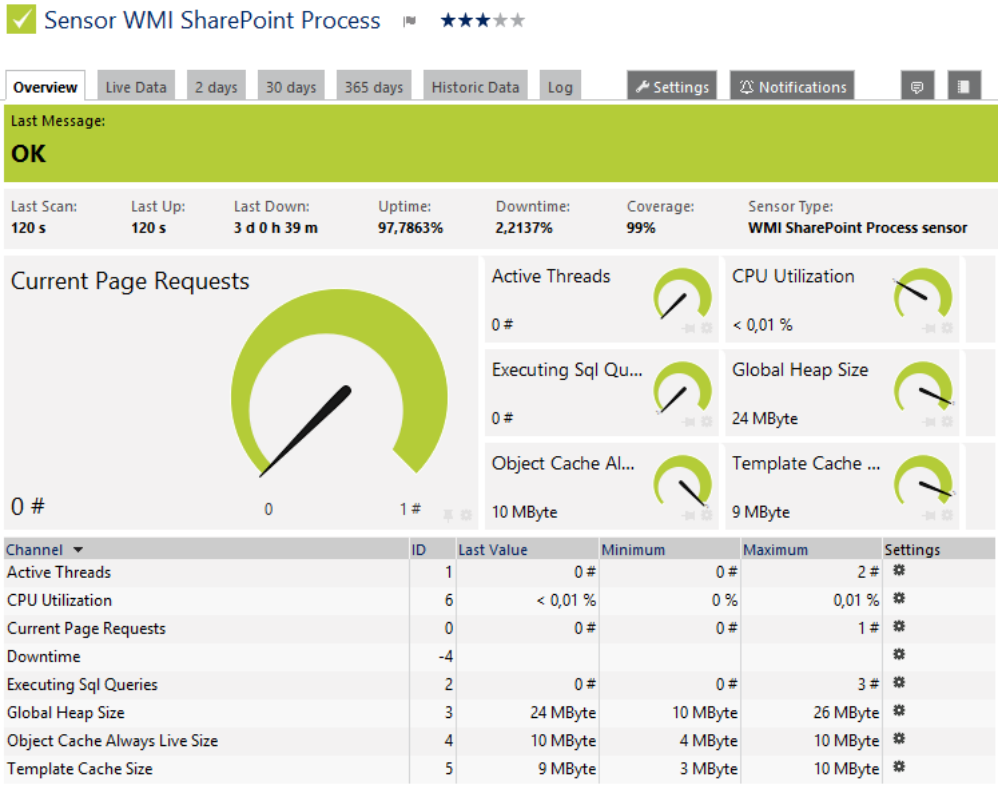
For more general information about settings, please see the **Object Settings** 188 section.

7.8.232 WMI SharePoint Process Sensor

The WMI SharePoint Process sensor monitors a Microsoft SharePoint server using Windows Management Instrumentation (WMI).

It can show the following:

- Number of current page requests
- Number of active threads
- Number of currently executed SQL queries
- Global heap size
- Object cache always live size
- Template cache size
- CPU utilization in percent



WMI SharePoint Process Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_sharepoint_process.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the SharePoint processes you want to monitor. PRTG creates one sensor for each process you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI PROCESS MONITOR

SharePoint Processes	You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI PROCESS MONITOR

SharePoint Process	The name of the SharePoint process that is monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

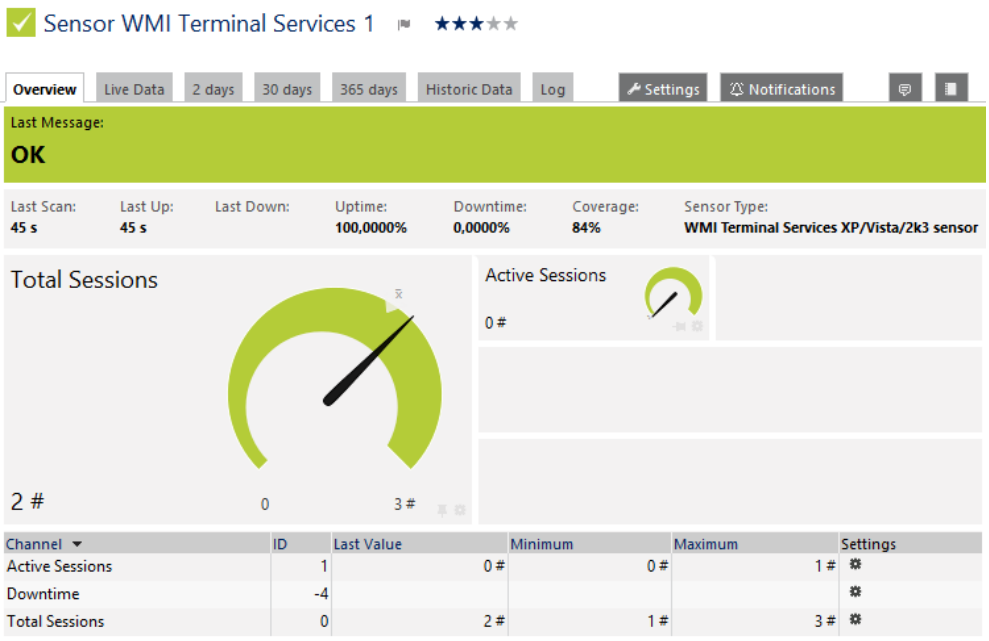
For more general information about settings, please see the **Object Settings** 188 section.

7.8.233 WMI Terminal Services (Windows 2008+) Sensor

The WMI Terminal Services sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server using Windows Management Instrumentation (WMI).

It shows the following:

- Number of active sessions: sessions with a currently logged in user, including used published applications
- Number total sessions (including inactive sessions): inactive sessions can be sessions with a disconnected user that has not logged out, or system services using a session



WMI Terminal Services Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_terminal_services.png

Remarks

- For "Total Sessions", this sensor type returns the number of active and inactive sessions, plus two additional sessions: one for the console, and another for the services. So, the number of total sessions may actually be higher than expected.
- Depending on the OS that you want to monitor, select either the sensor for Windows XP/ Vista/2003 or the one for Windows 2008 and later.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

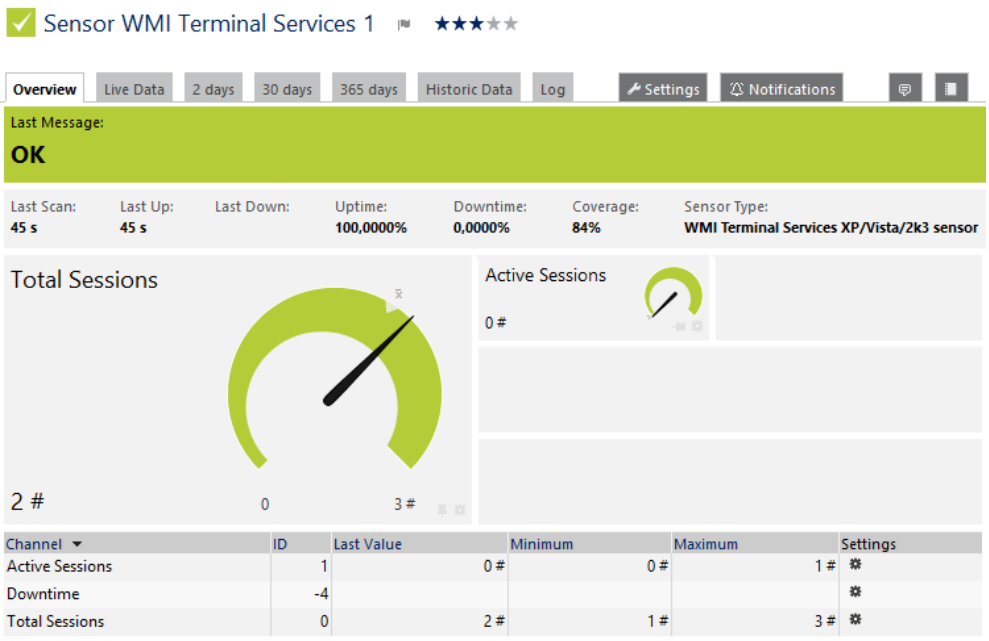
For more general information about settings, please see the **Object Settings** 188 section.

7.8.234 WMI Terminal Services (Windows XP/Vista/2003) Sensor

The WMI Terminal Services sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server using Windows Management Instrumentation (WMI).

It shows the following:

- Number of active sessions: sessions with a currently logged in user, including used published applications
- Number total sessions (including inactive sessions): inactive sessions can be sessions with a disconnected user that has not logged out, or system services using a session



WMI Terminal Services Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_terminal_services.png

Remarks

- For "Total Sessions", this sensor type returns the number of active and inactive sessions, plus two additional sessions: one for the console, and another for the services. So, the number of total sessions may actually be higher than expected.
- Depending on the OS that you want to monitor, select either the sensor for Windows XP/ Vista/2003 or the one for Windows 2008 and later.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

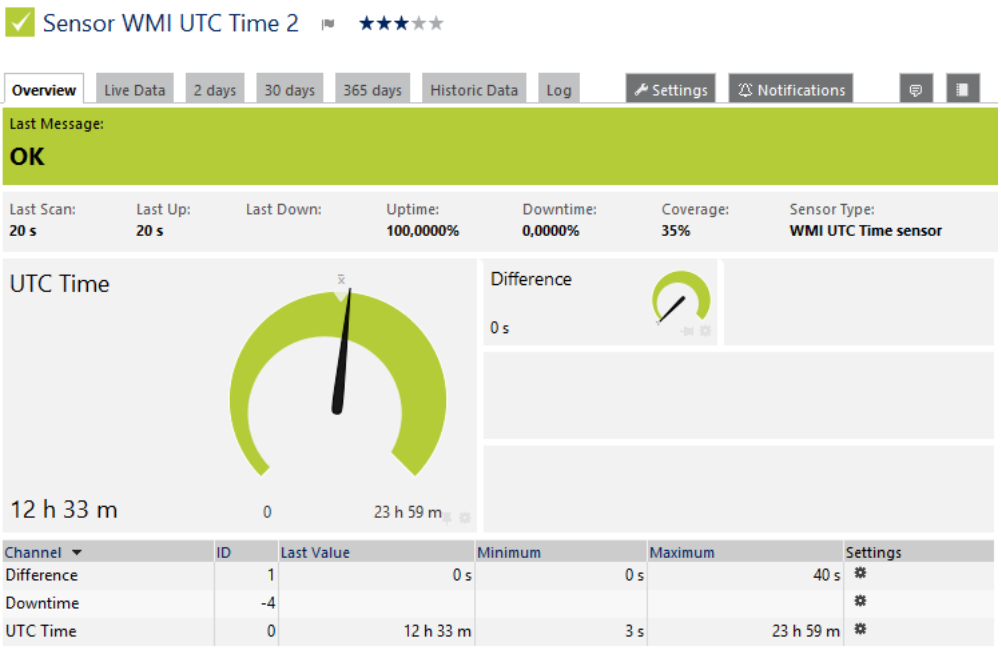
7.8.235 WMI UTC Time Sensor

The WMI UTC Time sensor monitors the UTC (Coordinated Universal Time) time of a target device using Windows Management Instrumentation (WMI).

It shows the following:

- UTC time of the target device
- Time difference between the PRTG system time and the target device in seconds



WMI UTC Time Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_utc_time.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

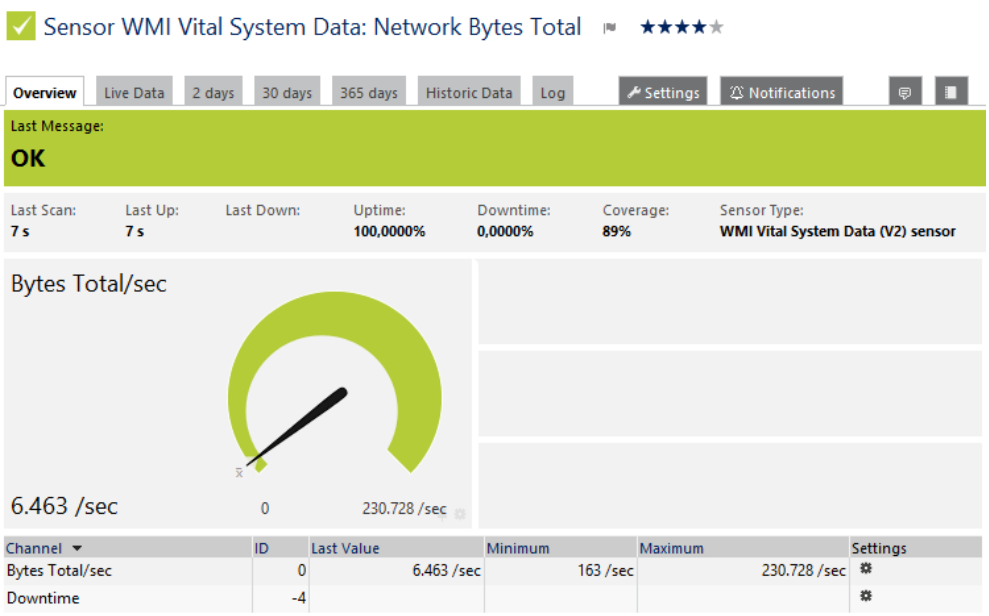
7.8.236 WMI Vital System Data (V2) Sensor

The WMI Vital System Data sensor monitors vital system parameters (CPU, thread, memory, network, pagefile) using Windows Management Instrumentation (WMI).

It can show the following:

- CPU usage: Processor, privileged, and user time
- CPU queue length
- Thread context switches
- Free physical memory
- Total visible memory
- Memory page faults, reads, and writes per second
- Memory pool paged and nonpaged bytes
- Memory committed bytes
- Network sent, received, and total bytes per second
- Network packets outbound errors
- Pagefile usage in percent
- Physical disk time in percent
- Current physical disk queue length
- Physical disk reads and writes per second
- Server bytes received, transmitted, and total
- CLR memory bytes in all heaps
- Thrown CLR exceptions per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



WMI Vital System Data (V2) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_vital_system_data.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters you want to monitor. PRTG creates one sensor for each counter you select in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

VITAL SYSTEM DATA READINGS ACCESSIBLE USING WMI

Performance Counter	You see a list of available vital system data values the sensor can monitor on the target device. The available options depend on your configuration. PRTG shows all possible performance counters with name and instance description (if available). Add check marks in front of the respective lines to select the desired items. One sensor will be created for each selection. You can also use the check box in the table head select and deselect all items. You can choose between the following counters: ▪ **CPU** ▪ **Thread** ▪ **Memory** ▪ **Network** ▪ **Pagefile**

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name Instance	These fields show the parameters that are used to query data for this sensor from the target device.Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

READINGS ACCESSIBLE USING WMI

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic. This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

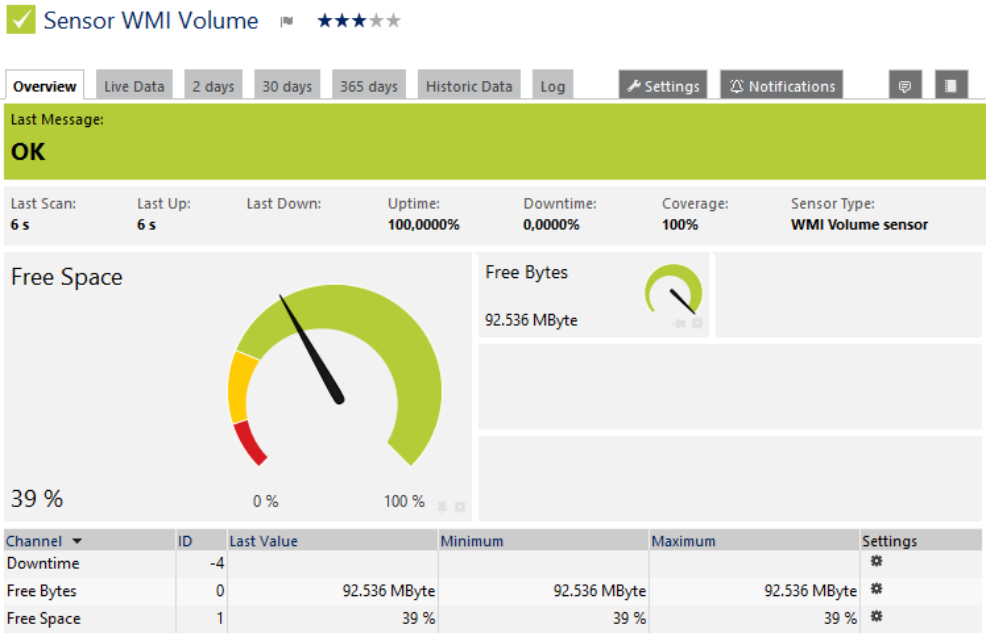
For more general information about settings, please see the **Object Settings** 188 section.

7.8.237 WMI Volume Sensor

The WMI Volume sensor monitors the free disk space on a drive, logical volume, or mount point using Windows Management Instrumentation (WMI). For each drive, logical volume or mount point, PRTG uses one sensor.

- It shows free space in percent and total.

This sensor monitors an area of storage on a hard disk. It can monitor local volumes that are formatted, unformatted, mounted, or offline. A volume is formatted by using a file system, such as File Allocation Table (FAT) or New Technology File System (NFTS), and might have a drive letter assigned to it. One hard disk can have multiple volumes, and volumes can span multiple physical disks. The sensor does not support disk drive management.



WMI Volume Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_volume.png

Remarks

- This sensor is not supported on Windows XP and earlier.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3092.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the volumes you want to monitor. PRTG creates one sensor for each volume you choose in the **Add Sensor** dialog. The settings you choose will be valid for all sensors that you create when you finish this dialog.

The following settings for this sensor differ in the Add Sensor dialog in comparison to the sensor's settings page.

WMI VOLUME SPECIFIC

Volumes	Select the volumes (drives, logical volumes, mount points) you want to add a sensor for. You see a list with the names of all items that are available to monitor. Add check marks in front of the respective lines to select the desired items. PRTG creates one sensor for each selection. You can also use the check box in the table head to select and deselect all items.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags**, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI VOLUME SPECIFIC

DeviceID	Shows the unique identifier of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Drive Type	Shows the type of the disk drive that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID Selection	Specify the way how sensor identifies the volume. Choose between: ▪ **Use system device ID (recommended)**: This is usually the best option for this sensor type, because the device ID will not change when the volume is renamed. ▪ **Use drive letter**: In a Microsoft cluster environment, the device ID will change when the cluster is switched to another node. In this case, use the drive letter option to avoid issues regarding this.
Drive Letter	This field is only visible if you select the drive letter option above. Enter the letter of the drive you want to monitor followed by a double dot, for example, C:

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section Data Storage 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2782 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. ⓘ Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

SCANNING INTERVAL

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916. Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.
Maintenance Begins	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Ends	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency. Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- https://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.8.238 WSUS Statistics Sensor

The WSUS Statistics sensor monitors various statistics on a Windows Server Update Services (WSUS) server using Windows Management Instrumentation (WMI).

It can show the numbers of the following:

- Approved updates
- Computers having update errors
- Computers needing updates
- Computers not synchronized for 7 days
- Computers registered
- Computers up to date
- Declined updates
- Expired updates
- Not approved critical or security updates
- Not approved updates
- Total updates
- Unapproved needed updates
- Updates needed by computers
- Updates needing files
- Updates up to date
- Updates with client errors
- Updates with server errors
- Updates with stale update approvals
- Number of WSUS infrastructure updates not approved for installation

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value	Minimum	Maximum	Settings
Approved updates	0	3,090 #	3,090 #	4,606 #	
Computers having update errors.	1	11 #	7 #	269,412 #	
Computers needing updates.	2	115 #	114 #	245 #	
Computers not synchronised for 7 days	3	8 #	4 #	102 #	
Computers registered	4	185 #	182 #	267 #	
Computers up to date	5	58 #	0 #	59 #	
Declined updates.	6	8,536 #	6,573 #	8,536 #	
Downtime	-4				
Expired updates.	7	0 #	0 #	0 #	
Not approved critical or security updates.	8	0 #	0 #	8 #	
Not approved updates.	9	0 #	0 #	733 #	
Total updates.	10	11,626 #	10,754 #	11,826 #	
Unapproved, needed updates.	11	0 #	0 #	106 #	
Updates needed by computers.	12	710 #	703 #	1,560 #	
Updates needing files.	13	26 #	0 #	703 #	
Updates up to date.	14	0 #	0 #	2,811 #	
Updates with client errors.	15	26 #	8 #	80 #	
Updates with server errors.	16	26 #	0 #	41 #	

WSUS Statistics Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wsus_statistics.png

Remarks

- Requires 2769 .NET 4.0 or higher on the probe system. If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- Requires 2769 WSUS 3.0 Administration Console on the probe system.

- Requires 2769 Windows credentials in the parent device settings 360.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use no more than 50 sensors of this sensor type on each probe.

You cannot add this sensor type to local probes in PRTG on demand. If you want to use this sensor type, please add it to a remote probe device.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe, either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3196. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6.

For more information, please see this Knowledge Base article: https://kb.paessler.com/en/topic/60543

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 365 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Requirement: WSUS 3.0 Administration Console

In order for this sensor to work, Microsoft's WSUS 3.0 Administration Console must be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe.

Add Sensor

The **Add Sensor** dialog appears when you manually 288 add a new sensor to a device. It only shows the setting fields that are required for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click the **Settings** tab to change its settings.

Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device where you created this sensor. See the **Device Settings** 360 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 151, as well as in alarms 190, logs 198, notifications 2829, reports 2862, maps 2885, libraries 2845, and tickets 200.
Parent Tags	Shows **Tags** 124 that this sensor inherits 124 from its parent device, group, and probe 118. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 124, separated by spaces or commas. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to the sensor if you like. Other tags are automatically inherited 124 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

WSUS Server Port	Define the port where the WSUS server service runs. The default value is **8530**. Please enter an integer value.
Connection Security	Define if you want to use SSL encryption for the connection to the WSUS server or if you prefer unencrypted connections. Choose between: ▪ **Use SSL** ▪ **Do not use any encryption**

SENSOR SETTINGS

If you want to use SSL encryption, you have to configure your Windows Server Update Services (WSUS) accordingly (see also the **More** 2777 section below).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the **Logs (Sensor)** directory in the PRTG data folder on the probe system the sensor is running on (on the Master node if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval.
  For more information on how to find the folder used for storage, see section **Data Storage** 3226.

You cannot access stored logs of sensors that run on the local probe of PRTG on demand.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor.

You can set another primary channel later by clicking the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph that visualizes the different components of your total traffic.
  This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2782 settings).

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 294 group's settings. To change a setting only for this object, disable inheritance by clicking the check mark in front of the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2955 on PRTG on premises installations.
If a Sensor Query Fails	Define the number of scanning intervals that a sensor has time reach and check a device again in case a sensor query fails. The sensor can try to re-reach and check a device several times, depending on the option you select here, before it will be set to a **Down** status 163. This helps you avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error.

SCANNING INTERVAL

- **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests.
- **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests.
- **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests.
- **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests.

Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor to "down" immediately, so the first option will not apply to these sensor types. All other options can apply.

If a sensor has defined error limits for channels, it will always show a **Down** status immediately, so no "wait" option will apply.

If a channel uses lookup 3183 values, it will always show a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) every week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2916.

Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Maintenance Window

Specify if you want to set up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between:

- **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active.
- **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window.

To terminate a current maintenance window before the defined end date, change the time entry in **Maintenance Ends** field to a date in the past.

Maintenance Begins

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.

Maintenance Ends

This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency Type

Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

- **Use parent**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency.
- **Select object**: Pause the current sensor if the device, where it is created on, is in **Down** status, or is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in **Down** status, or is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in **Down** status, or if it is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2822 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 210 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for a dependency delay. After the master object for this dependency goes back to **Up** status, PRTG will start monitoring the depending objects after this extra delayed. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 360 or in the superior **Group Settings** 334.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 129.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Custom channel types can be set on sensor level only.

- https://kb.paessler.com/en/topic/60543

Knowledge Base: Can I encrypt connections to my WSUS server?

- https://kb.paessler.com/en/topic/63611

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2782 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2791 section.

Others

For more general information about settings, please see the **Object Settings** 188 section.

7.9 Additional Sensor Types (Custom Sensors)

Users can create and use their own, self-written custom sensors in PRTG Network Monitor to go far beyond PRTG's standard sensor set. You can create your own sensors using Windows Management Instrumentation Query Language (WQL), visual basic scripting, PowerShell, batch scripting, SQL queries, by compiling an EXE or DLL file (using any Windows software development tool), and by running Python scripts.

You cannot use custom sensors on local probes in PRTG on demand (except SSH sensors). If you want to use custom sensors, please add them to a remote probe device.

Basics

For a general introduction, please see the sections about EXE/Script sensors and the API documentation 3174 which contains details about the necessary return format for these sensors. WMI Custom sensors allow executing WQL requests.

- **EXE/Script Sensor** 747
- **EXE/Script Advanced Sensor** 759
- **Python Script Advanced Sensor** 1385
- **SSH Script Sensor** 2266
- **SSH Script Advanced Sensor** 2278
- **Application Programming Interface (API) Definition** 3174
- **WMI Custom Sensor** 2512

Additionally, some types of SQL sensors execute script files with SQL queries:

- **Microsoft SQL v2 Sensor** 1135
- **MySQL v2 Sensor** 1151
- **Oracle SQL v2 Sensor** 1253
- **PostgreSQL Sensor** 1363

Custom Sensors Included in PRTG

After installing PRTG Network Monitor, you will already find a selection of custom EXE/Script, Python, and WMI WQL script sensors in the PRTG program directory 3226, as well as scripts with SQL queries for specific database sensors 2778. Many of these are sample projects that you can edit and improve for your needs.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\EXE

- Demo Batchfile - Returns 200.bat
- Demo Batchfile - Set sensorstate to error.bat
- Demo Batchfile - Set sensorstate to warning.bat

- Demo Cmd - Returns 200.cmd
- Demo Dll - Returns a random integer.dll
- Demo EXE - Returns a random integer.exe
- Demo EXE - Returns number of files in folder (parameter).exe
- Demo EXE - Returns user of process.exe
- Demo Powershell Script - Available MB via WMI.ps1
- Demo Powershell Script - InterruptsPerSec via WMI.ps1
- Demo Powershell Script - Powershell Version.ps1
- Demo Powershell Script - Returns a fixed integer value.ps1
- Demo Powershell Script - Returns a random integer value.ps1
- Demo Powershell Script - Returns Random Integer and Warnings.ps1
- Demo VBScript - InterruptsPerSec via WMI.vbs
- Demo VBScript - Multiplies two integers(2 parameters).vbs
- Demo VBScript - Returns a fixed float value.vbs
- Demo VBScript - Returns a fixed integer value.vbs
- Demo VBScript - Returns a random value.vbs
- Demo VBScript - Returns number of svchost processes.vbs
- Demo VBScript - Returns user of process.vbs
- Demo VBScript - Returns warning depending on number of svchost processes.vbs
- Demo VBScript - Timezone via WMI.vbs
- Demo VBScript - UTCTime via WMI.vbs
- Load_Test_CPU_1_Mio_Primes.exe
- Load_Test_CPU_10_Mio_Primes.exe
- Load_Test_Disk_Write_Read_1000_files.exe
- Load_Test_Disk_Write_Read_10000_files.exe
- Load_Test_Memory_Allocate_And_Free_400MB.exe

To create a new sensor based on one of these files, create a new **EXE/Script Sensor** 747 and choose the respective file from the **EXE/Script** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\EXEXML

- Demo Batchfile - Returns static values in four channels.bat

To create a new sensor based on one of these files, create a new **EXE/Script Advanced Sensor** 759 and choose the respective file from the **EXE/Script** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\python

- sensor_example.py

This Python example script just returns fixed values in two channels to demonstrate the usage. To create a new sensor based on this file, create a new **Python Script Advanced Sensor** 1385 and choose the file from the **Python Script** list in the sensor settings.

SQL Query Files Included in PRTG—Folder: \Custom Sensors\sql\<dbms>

- Demo Serveruptime.sql

You can find this demo SQL query script in each subfolder for each supported database management system (dbms): **\mssql**, **\mysql**, **\oracle**, **\postgresql**

To create a new sensor that uses one of the scripts in the dbms folders, create the according sensor type (see above for supported sensors 2778) and choose the respective file from the **SQL Query File** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\WMI WQL scripts

- Demo WQL Script - Get Win32LogicalDiscFreeMB.wql
- Demo WQL Script - Get Win32OsBuildnumber.wql
- Demo WQL Script - Get Win32PercentProcessorIdleTime.wql
- Demo WQL Script - Get Win32PercentProcessorTime.wql

To create a new sensor based on one of these files, create a new **WMI Custom Sensor** 2512 and choose the respective file from the **WQL File** list in the sensor settings.

Downloading Pre-Built Custom Sensors

Good resources to find custom sensors that PRTG users and we from Paessler share are the **PRTG Script World** and our Knowledge Base. In the Knowledge Base, search for the tag **custom-script-exe** to find a lot of custom sensors: https://kb.paessler.com/en/tags/custom-script-exe/

More

You can find useful scripts for sensors in the **PRTG Script World**:

- https://www.paessler.com/script-world

For the other sensor types that work out-of-the-box, please see

- **List of Available Sensor Types** 385

Knowledge Base: Guide for PowerShell Based Custom Sensors

- https://kb.paessler.com/en/topic/71356

Knowledge Base: Custom sensors

- https://kb.paessler.com/en/tags/custom-script-exe/

Knowledge Base: How can I share my self-written PRTG script/program with other PRTG users?

- https://kb.paessler.com/en/topic/63737

Knowledge Base: How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?

Sensor Settings Overview

For information about sensor settings, please see the following sections:

- **Sensor Settings—384 List of Available Sensor Types 385**
- **Additional Sensor Types (Custom Sensors) 2778**
- **Sensor Channels Settings 2782**
- **Sensor Notifications Settings 2791**

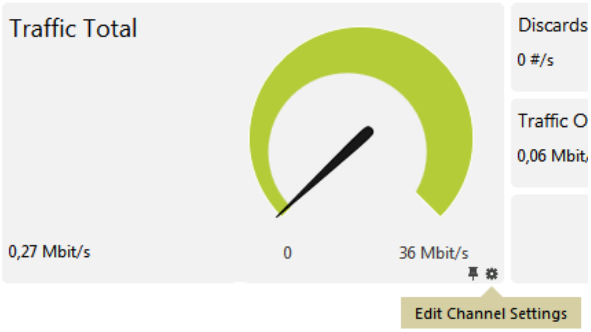
7.10 Sensor Channels Settings

A sensor has one or more channels in which it handles the actual monitoring data. In the channel settings, you can define how to display the data from the sensor's different channels displayed in graphs, gauges, and tables. Additionally, the channel data can determine the sensor status [163]. Use the limit settings to achieve this.

On the sensor's **Overview** tab, click the gear icon of a specific channel gauge to change its settings. Click the pin symbol on the left of the gear icon in a gauge to make this channel the primary channel of the selected sensor.

You can also open the settings of a channel by clicking the respective gear icon in the channels data table.

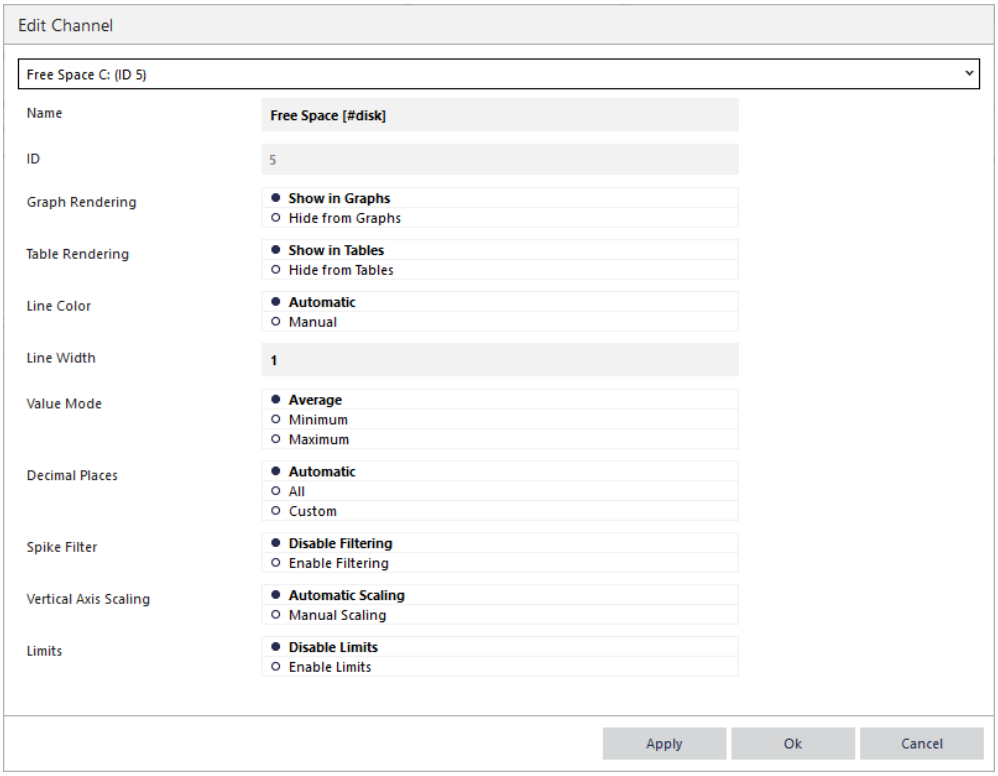
For lookup [3183] channels, we recommend that you stay below 120 lookup values to get expressive gauges. For non-primary lookup channels, the upper limit is around 40 lookup values.



The Gear Icon of an SNMP Traffic Total Channel to Open Channel Settings

The available options are nearly the same for all sensor types. An exception applies to the **Downtime** channel, which is automatically calculated and does not offer all settings. Channels with "absolute" values additionally have an option for defining the **Value Mode**.

You can quickly choose another channel of the selected sensor via the dropdown list at the top of the channel settings dialog.



Channel Settings for a Disk Sensor

Available Channel Settings

EDIT CHANNEL

Name	Enter a meaningful name to identify the channel (not editable for script sensors after sensor creation). The name will appear in graphs and tables. You can automatically add the sensor's ID to the name by using the placeholder **[#id]**.
Unit	This field is only visible for custom sensors. Enter a string that describes the unit of the returned values. This is for display purposes only. Please enter a string.
Scaling Multiplication	This field is only visible for channels with a custom unit. If you want to multiply the received raw data by a certain value, enter the multiplier here. Please enter an integer value. Otherwise, use the default value 1 to not change the received value. ⓘ The following sensor types provide the scaling factor for received values with custom units in their sensor settings.

EDIT CHANNEL

	▪ Sensor Factory Sensor 1440 (you can use multiplication and division in the channel definition) ▪ SNMP APC Hardware Sensor 1532 ▪ SNMP Custom Sensor 1650 ▪ SNMP Dell Hardware Sensor 1731 ▪ SNMP Library Sensor 1916 ▪ WMI Custom Sensor 2514
Scaling Division	This field is only visible for channels with a custom unit. If you want to divide the received raw data by a certain value, enter the divisor here. Please enter an integer value. Otherwise, use the default value 1 to not change the received value. The following sensor types provide the scaling factor for received values with custom units in their sensor settings. ▪ Sensor Factory Sensor 1440 (you can use multiplication and division in the channel definition) ▪ SNMP APC Hardware Sensor 1532 ▪ SNMP Custom Sensor 1650 ▪ SNMP Dell Hardware Sensor 1731 ▪ SNMP Library Sensor 1916 ▪ WMI Custom Sensor 2514
Value Lookup	This field is only visible for custom sensors. Select the lookup 3183 file that you want to use with this channel. Do not use this option for sensors that provide the unit **Value Lookup** in the sensor settings! This channel setting will be overwritten with the next sensor scan. Please define the lookup file that you want to use with this channel on the **Settings** tab of this sensor. Choose the option **Value Lookup** for the setting **Sensor Channel** #x **Unit** (where x is the number of the channel) and choose the desired lookup file under **Sensor Channel** #x **Value Lookup**. See also manual section Define Lookups—Requirement: Channel Unit "Custom" 3183 for affected sensor types.
ID	Shows the ID of the channel. You cannot change the ID. PRTG uses it for unique identification. For example, you need the ID when using Sensor Factory 1438 sensors.

EDIT CHANNEL

	There are a few special channel IDs that are fixed: ▪ -1 is for sum channels of traffic channels (for example, of the **SNMP Traffic Sensor** 2132). ▪ -4 is for the **Downtime** channel (you can use it, for example, for an uptime percentage calculation in a **Sensor Factory Sensor** 1438). ▪ -2 (coverage) and -3 (error) are used internally.
Graph Rendering	Define if you want to show this channel in data graphs 170. Choose between: ▪ **Show in Graphs**: Sensor graphs contain the data of this channel. ▪ **Hide from Graphs**: Sensor graphs do not contain data of this channel. If you choose to hide this channel in graphs, it will also not appear in a **Report** 2862 if you include this graph.
Table Rendering	Define if you want to show this channel in data tables 166. Choose between: ▪ **Show in Tables**: Sensor data tables contain the data of this channel. ▪ **Hide from Tables**: Sensor data tables do not contain the data of this channel. This option hides the channel gauge as well, but the channel will still be available in the data table of the sensor's **Overview** tab. If you choose to hide this channel in data tables, PRTG will also not use it for the calculation of the "sum" (total) channel of the sensor.
Line Color	Define the color of the channel display in graphs. Choose between: ▪ **Automatic**: PRTG sets the color of this channel in graphs automatically. ▪ **Manual**: Individually define the color of this channel. You can enter the desired color code below.
Color (#rrggbb)	This option is only available if you choose manual line color above. Enter a color in hexadecimal RGB notation (as in HTML/CSS), or choose a color from the visual color selector. The field with the hexadecimal color value will change to the selected color automatically.

EDIT CHANNEL

Line Width	Define the width of the channel line in graphs. Enter an integer value in pixels. The maximum line width is 25px, but we recommend that you use values between 1 and 7 only to get optimal results.
Data	This setting is available for most channels. Define how to display data. Choose between: ▪ **Display actual values in** [unit]: Display the values in the unit shown. ▪ **Display in percent of maximum**: Calculate and show percent values based on a maximum value. Provide a maximum below. ⓘ If you choose this option, you cannot display the data of traffic sensors as a positive and negative area graph.
Maximum ([unit])	This field is only visible if you choose the percent of maximum setting above. Enter a value to use as maximum. Please pay attention to the given unit. PRTG calculates all percent values based on this value. Please enter an integer value.
Value Mode	This setting is only available for sensor channels that return absolute values. It is not available for sensors showing difference values, such as traffic channels. Depending on this setting, the channel cannot only show averages, but also minimum or maximum values in the graphs for the respective time spans. Choose between: ▪ **Average**: The channel shows average values. ▪ **Minimum**: The channel shows minimum values. ▪ **Maximum**: The channel shows maximum values. See this Knowledge Base article for more information about the value modes: What is the Value Mode in channel settings?
Decimal Places	Define how many decimal places of the channel's data to display in graphs and tables. Choose between: ▪ **Automatic**: PRTG automatically defines how many decimal places are used for optimal viewing results. ⓘ Values between 10 and -10 are rounded to two decimal places. Values that are very close to an integer are rounded to the integer (for example, 3.001 is rounded to 3). ▪ **All**: Display all available decimal places. ▪ **Custom**: Manually define the number of decimal places. If you choose this option, an additional field will appear. Please enter an integer value.

EDIT CHANNEL

Spike Filter	You can use a spike filter to correct faulty monitoring data. Sometimes, sensors report enormously high or far too low values. This can be because of an error in data transmission, or because of incompatibilities of the physical device you are monitoring. This can make graphs unreadable. A spike filter can compensate for these flaws. If you enable a spike filter, values above and below a certain limit are disregarded in the monitoring data for graphs and tables. Choose between: ▪ **Disable Filtering**: Display all data as it is received. Do not filter out spikes. ▪ **Enable Filtering**: Enable a filter to remove spike values. Additional fields appear below. ⓘ This does not change monitoring data itself but only the presentation of the data. This setting is valid for all data of this channel, including historic data. ⓘ The spike filter option is not available for the channel **Downtime**.
Spike Filter Max. Value [unit]	This field is only visible if you enable the spike filter above. Enter the maximum value to show in the channel data. PRTG disregards all data above this value in graphs and tables. Please enter an integer value or leave the field empty.
Spike Filter Min. Value [unit]	This field is only visible if you enable the spike filter above. Enter the minimum value to show in the channel data. PRTG disregards all data below this value in graphs and tables. Please enter an integer value or leave the field empty.
Vertical Axis Scaling	Define how to display the vertical axis for the channel in graphs. Choose between: ▪ **Automatic Scaling**: PRTG automatically uses the optimum scaling. Usually the scaling ranges from the minimum to the maximum value. PRTG uses one single scale for each unit label only. ▪ **Manual Scaling**: Define the scaling manually. Additional fields appear below. Defining manual axis scaling can make low values better visible in your graph, but it may result in a graph with multiple vertical axes for the same unit label. ⓘ Settings for this option are ignored if you enable the Chart Type **Stack channels on top of each other** or **Show in and out traffic as positive and negative area chart** (available for traffic sensors) on the sensor's **Settings** tab.

EDIT CHANNEL

Vertical Axis Maximum [unit]	This field is only visible if you enable vertical axis scaling above. Enter the maximum value to use on the vertical axis for the channel. Please enter an integer value.
Vertical Axis Minimum [unit]	This field is only visible if you enable vertical axis scaling above. Enter the minimum value to use on the vertical axis for the channel. Please enter an integer value.
Limits	Define if you want to use thresholds for this channel. The channel can affect the status of the sensor 163 it is part of. With limits you can define when the sensor will show a **Warning** or **Down** status, depending on the channel data. For example, you can use this function to set a traffic sensor (which is usually never in a down state) to error when the monitored values reach critical limits. Choose between: ▪ **Disable Limits**: Do not use the channel data to control the sensor status. ▪ **Enable Limits**: Define limits. Additional fields appear below. The sensor of this channel will enter a **Warning** or **Down** status when limits are undercut or overrun. ⓘ The limits option is not available for the channel **Downtime**. ⓘ If a channel uses lookups 3183, we strongly recommend that you control the sensor status only via the lookup definition. If you define limits in addition here, the sensor will use both the channel limits and the status as defined in the lookup file. In this case, channel limits will determine the overall status of the sensor and overwrite the sensor message while the channel gauge still shows the status as defined in the lookups. ⓘ You can show limits in graphs (highlighted in yellow or red) if you select exactly one channel with a limit in a graph.
Upper Error Limit [unit]	This field is only visible if you enable limits above. Specify an upper limit for a **Down** status. If the channel values overrun this value, the sensor will be **Down**. Please enter an integer value or leave the field empty. ⓘ While a sensor shows a **Down** 163 status triggered by a limit, it will still receive data in its channels.
Upper Warning Limit [unit]	This field is only visible if you enable limits above. Specify an upper limit for a **Warning** status. If the channel values overrun this value, the sensor will be **Warning**. Please enter an integer value or leave the field empty.

EDIT CHANNEL

Lower Warning Limit [unit]	This field is only visible if you enable limits above. Specify a lower limit for a **Warning** status. If the channel values undercut this value, the sensor will be **Warning**. Please enter an integer value or leave the field empty.
Lower Error Limit [unit]	This field is only visible if you enable limits above. Specify a lower limit for a **Down** status. If the channel values undercut this value, the sensor will be **Down**. Please enter an integer value or leave the field empty. While a sensor shows a **Down** 163 status triggered by a limit, it will still receive data in its channels.
Error Limit Message	This field is only visible if you enable limits above. Enter an additional message. It will be added to the sensor message when showing a **Down** status. Please enter a string or leave the field empty.
Warning Limit Message	This field is only visible if you enable limits above. Enter an additional message. It will be added to the sensor message when showing a **Warning** status. Please enter a string or leave the field empty.

Click **Ok** to save your settings and to close the settings window. Click **Apply** to save the changed settings while the **Edit Channel** window remains open. This functionality is useful if you want to change the settings of other channels of the current sensor as well. You can select another channel via the dropdown menu above the settings. You can close the settings window without saving by clicking **Cancel**.

If you have changed any settings and click **Cancel** or choose another channel via the dropdown menu without applying the changes, PRTG will ask you to confirm this step. **Discard Changes** will ignore any edits and closes the window or shows the settings of another selected channel. Click **Save** to apply your changes.

Sensor Settings Overview

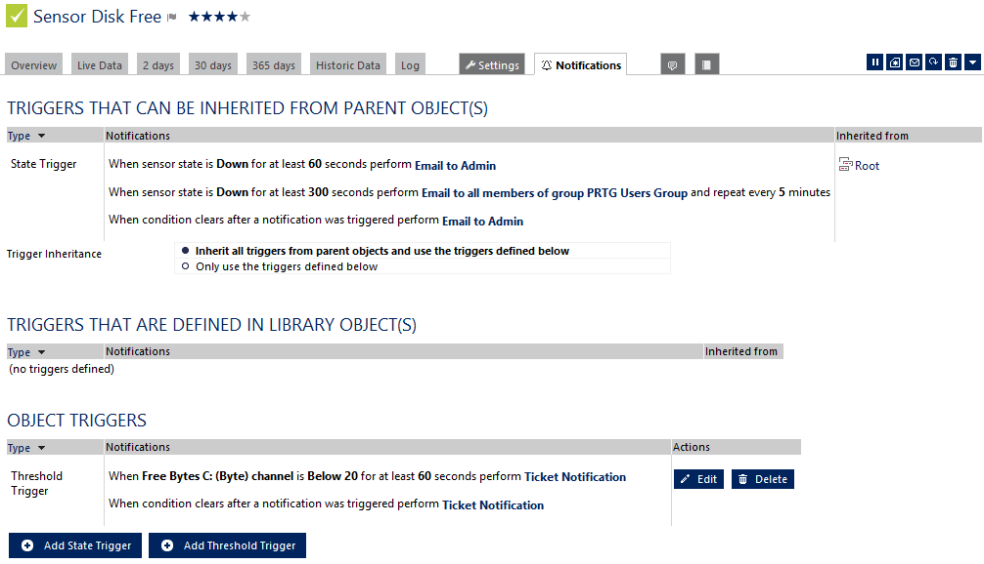
For information about sensor settings, please see the following sections:

- **Sensor Settings**— 384 **List of Available Sensor Types** 385
- **Additional Sensor Types (Custom Sensors)** 2778
- **Sensor Channels Settings** 2782

- Sensor Notifications Settings 2791

7.11 Sensor Notifications Settings

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to your needs.



Example of Notification Trigger Settings

Click here to enlarge: http://media.paessler.com/prtg-screenshots/notification_trigger.png

Although the sensors activate a trigger, you can set notification triggers higher in the hierarchy (for example for groups or devices). Because of this you can define triggers for multiple sensors using the inheritance mechanism 122. Monitoring objects with inherited triggers show these in section **Triggers That Can Be Inherited From Parent Object(s)** on the **Notifications** tab.

PRTG already includes a default notification trigger for the **Root Group** 118. This default trigger provokes the standard notification **Email and push notification to admin** if there is any sensor in down status 163 in your PRTG installation for at least 10 minutes.

You can also define notification triggers in **Libraries** 2845. Sensors that are in a library with defined triggers show these triggers in section **Triggers That Are Defined in Library Object (s)** on the **Notifications** tab.

Note

This section describes one of four steps to set up the notification system in PRTG. A complete notification setup involves:

1. Checking and setting up the **Notification Delivery** settings. This tells PRTG how and where to send messages.
   For detailed information, see **System Administration—Notification Delivery** 2961.

2. Checking and setting up **Notification Contacts** for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** 2934.
3. Checking and setting up **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** 2916.
4. Checking and setting up **Notification Triggers** for objects. This provokes the defined notifications.
   For detailed information, see **Sensor Notifications Settings** 2791.

We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2922 and one SMS notification 2924. If delivery via email fails (due to an email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a state trigger 2793 and a notification via a delivery method other than the one for the first trigger. Or set up a second trigger with another notification for the corresponding object.

For background information, please see the **Notifications** 2829 section.

Available Notification Triggers Settings

On an object's detail page, open the **Notifications** tab to change sensor notification triggers. The available options are the same for all objects. When defining triggers for probes, groups, or devices, they can be inherited down to sensor level.

TRIGGERS THAT CAN BE INHERITED FROM PARENT OBJECT(S)

You see a list of all notification triggers that are defined higher in the hierarchy. The list is empty and shows the message **(no triggers defined)** when you have not set any triggers in probes, groups, or devices above the current object in the **Object Hierarchy** 118. You can see the **Type** of trigger and the **Notifications** that the monitoring object executes once this trigger is activated.

Trigger Inheritance	Define if you want to use the triggers shown above on the current object. Choose between: ▪ **Inherit all triggers from parent objects and use the triggers defined below**: Use the triggers shown above. If the defined condition is met, the corresponding trigger is activated and the notification provoked. Click the notification name to open its settings page 2916. Click the name of the monitoring object in the column **Inherited from** to open its **Overview** tab. ▪ **Only use triggers defined below**: Do not use the triggers shown above. Only use the triggers that you define below in section **Object Triggers** for this object. This setting is valid for all triggers shown above. It is not possible to only select some of the triggers.

In section **Triggers that are defined in library object(s)** you see all notification triggers that are set for **Libraries** 2845 that contain the currently selected sensor.

TRIGGERS THAT ARE DEFINED IN LIBRARY OBJECT(S)

You see a list of all notification triggers that are defined in libraries that include the currently selected sensor. The list is empty and shows the message **(no triggers defined)** when you have not set any triggers in libraries that contain the current sensor. You can see the **Type** of trigger and the **Notifications** that the sensor executes once this trigger is activated.

Click the notification name to open its settings page 2916. Click a library name in the column **Inherited from** to view this library.

You cannot turn off trigger usage for the current sensor from a library here. If you do not want to use any notification triggers from a library for this sensor, open the library and remove this sensor from it or refine the triggers on the **Notifications** 2859 tab.

You can set up one or more of the following triggers, each with different setting options. Which trigger types are visible depends on the kind of object you edit:

- Add State Trigger 2793
- Add Speed Trigger 2795
- Add Volume Trigger 2797
- Add Threshold Trigger 2799
- Add Change Trigger 2800

You can create all notification triggers by forming sentences in "natural language". There are different options available for every type.

Add State Trigger

Define a trigger that is activated when a sensor changes its current status. This is the most common reason to send out notifications. Click the **Add State Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more notification(s) 2916 to be executed.

STATE TRIGGER

When sensor state is [...]	Select the condition that will trigger the notification. The trigger will be activated when a sensor enters the selected status. Choose from the dropdown menu: ▪ **Down**: The trigger is activated if a sensor changes to a **Down** status.

STATE TRIGGER

	▪ **Warning**: The trigger is activated if a sensor changes to a **Warning** status. ▪ **Unusual**: The trigger is activated if a sensor changes to an **Unusual** status. ▪ **Partial Down**: The trigger is activated if a sensor changes to a **Down (Partial)** status (available in a cluster 116 configuration).
...for at least [...] seconds	Define how many seconds PRTG waits before it sends out a notification (latency). This can avoid false alarms if a sensor 'flickers' and, for example, changes to a down status for just a few seconds. If the selected condition (the sensor status) persists after the defined time in seconds, the notification is triggered. Please enter an integer value. Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger! The notification trigger might not work as expected in this case. .
...perform [...]	Select a notification that PRTG sends out if the selected condition (the sensor status) is true and the latency time defined has elapsed. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notifications 2916 settings. You can also choose **no notification** to only use other conditions for this trigger.
When sensor state is [...] for at least [...] seconds	Define an escalation latency in seconds. This "escalation" triggers a second notification if the number of seconds you enter here has passed since the sensor status has entered the defined condition. Use this to automatically escalate a notification in case a problem persists for a longer time. Please enter an integer value. PRTG automatically takes the status from the first trigger condition above.
...perform [...]	Select a (second) notification that PRTG sends out if the selected condition (the sensor status) is true and the escalation latency time defined has elapsed. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notifications 2916 settings. You can also choose **no notification** to only use other conditions for this trigger. Select a notification with another delivery method than above to ensure the delivery in case of technical issues with the first notification.

STATE TRIGGER

...and repeat every [...] minutes	Define an interval in minutes in which PRTG sends the escalation notification (defined above) repeatedly. The second (escalation) notification defined will be resent every x minutes that you enter here. Please enter an integer value. If you enter 0, PRTG will not send repeating escalation notifications.
When condition clears after a notification was triggered perform [...]	Select a notification that PRTG sends out if the selected condition (the sensor status) is not true anymore because the sensor status changed again. Choose a notification from the dropdown menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2916 settings. You can also choose **no notification** to only use other conditions for this trigger. PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select **no notification** above, you will get the notification about the cleared condition nevertheless if you define it here. The definition of an "escalation" notification does not influence notifications for cleared conditions.
Save	Click **Save** to confirm your settings.
Cancel	Click **Cancel** to undo your changes.

Add Speed Trigger

Define a trigger that is activated when the currently monitored speed in a sensor changes (for example, a traffic sensor). Click the **Add Speed Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more notification(s) 2916 to be executed.

SPEED TRIGGER

When [...] **channel**	From the dropdown menu, select the channel whose data PRTG considers for speed comparison. Select **Primary** to generally use the primary channel of a sensor (you can define this in the sensor settings 384), or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger are based on the chosen channel.
...is [...]	Select the condition that will trigger the notification. Choose from the dropdown menu:

SPEED TRIGGER

	▪ **Above**: The trigger is activated if the value of the selected channel exceeds a defined value. ▪ **Below**: The trigger is activated if the value of the selected channel falls below a defined value. ▪ **Equal to**: The trigger is activated if the value of the selected channel is the same as a defined value. ▪ **Not Equal to**: The trigger is activated if the value of the selected channel is different than a defined value.
[value]	Define the value to which PRTG compares the channel data. Please enter an integer value.
[scale]	From the dropdown menu, select the unit in which you entered the **[value]** above. **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally. Choose from: ▪ **bit** ▪ **kbit** ▪ **Mbit** ▪ **Gbit** ▪ **Tbit** ▪ **Byte** ▪ **KByte** ▪ **MByte** ▪ **GByte** ▪ **TByte**
[time]	Select the time for the scale (so you create a scale per time unit). Choose from the dropdown menu: ▪ **second** ▪ **minute** ▪ **hour** ▪ **day** **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit PRTG will automatically convert values internally.

SPEED TRIGGER

..for at least [...] seconds	Define how many seconds PRTG waits before it sends out a notification (latency). This can avoid false alarms if a channel reaches a limit for just a few moments. If the combined channel condition of **[value]**, **[scale]**, and **[time]** persists after the defined time span, the notification will be triggered. Please enter an integer value. Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger! The notification trigger might not work as expected in this case.
...perform [...]	Select a notification that is triggered if the combined channel condition of **[value]**, **[scale]**, and **[time]** is true and the latency time defined has elapsed. Choose a notification from the dropdown menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2916 settings. You can also choose **no notification** to only use other conditions for this trigger.
When condition clears perform [...]	Select a notification that is triggered if the combined channel condition of **[value]**, **[scale]**, and **[time]** is not true anymore because the channel value has changed again. Choose a notification from the dropdown menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2916 settings. You can also choose **no notification** to only use other conditions for this trigger. PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select **no notification** above, you will get the notification about the cleared condition nevertheless if you define it here.
Save	Click **Save** to confirm your settings.
Cancel	Click **Cancel** to undo your changes.

No escalation notification and no repeat are available for this trigger type.

Add Volume Trigger

Define a trigger that is activated when a sensor (for example, a traffic sensor) reaches a certain volume limit in a specified time. Click the **Add Volume Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more notification(s) 2916 to be executed.

VOLUME TRIGGER

When [...] **channel**	From the dropdown menu, select the channel whose data PRTG considers for this comparison. Select **Primary** to generally use the primary channel of a sensor (you can define this in the sensor settings 384), or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger are based on the chosen channel.
...has reached [value]	Define the value to which PRTG compares the channel data. If the channel data exceeds this value, a notification is triggered. Please enter an integer value.
[scale]	From the dropdown menu, select the unit in which you entered the **[value]** above. **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally. Choose between: ▪ **Byte** ▪ **KByte** ▪ **MByte** ▪ **GByte** ▪ **TByte**
per [time]	Select the time for the scale (so you create a scale per time designation). Choose from the dropdown menu: ▪ **Hour** ▪ **Day** ▪ **Week** ▪ **Month** **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally.
...perform [...]	Select a notification that is triggered if the **[value]** in the combined unit of **[scale]** and **[time]** is exceeded. Choose a notification from the dropdown menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2916 settings. You can also choose **no notification** to only use other conditions for this trigger.
Save	Click **Save** to confirm your settings.
Cancel	Click **Cancel** to undo your changes.

No escalation notification, no repeat, and no notification when condition clears are available for this trigger type.

Add Threshold Trigger

Define a trigger that is activated when a sensor reaches specific values. Click the **Add Threshold Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more notification(s) 2916 to be executed.

THRESHOLD TRIGGER

When [...] **channel**	From the dropdown menu, select the channel whose data PRTG considers for this comparison. Select **Primary** to generally use the primary channel of a sensor (you can define this in the sensor settings 384), or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger are based on the chosen channel.
...is [...]	Select the condition that will trigger the notification. Choose from the dropdown menu: ▪ **Above**: The trigger is activated if the value of the selected channel exceeds a defined value. ▪ **Below**: The trigger is activated if the value of the selected channel falls below a defined value. ▪ **Equal to**: The trigger is activated if the value of the selected channel is the same as a defined value. ▪ **Not Equal to**: The trigger is activated if the value of the selected channel is different than a defined value.
[value]	Define the value PRTG will compare the channel data to. Enter values in the smallest possible (base) unit, for example, in bytes, milliseconds, or percent. Please enter an integer value.
..for at least [...] seconds	Define how many seconds PRTG waits before it sends out a notification (latency). This can avoid false alarms in case a channel reaches a limit for just a few moments. If the defined channel condition persists after the defined time span, the notification is triggered. Please enter an integer value. Do not define a latency that is shorter than the scanning interval of a sensor that uses this trigger! The notification trigger might not work as expected in this case.

...perform [...]	Select a notification that is triggered if the defined channel condition is true and the latency time defined has elapsed. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notifications 2916 settings. You can also choose **no notification** to only use other conditions for this trigger.
When condition clears perform [...]	Select a notification that is triggered if the defined channel condition is not true any more because the channel value has changed again. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notifications 2916 settings. You can also choose **no notification** to only use other conditions for this trigger. PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select **no notification** above, you will get the notification about the cleared condition nevertheless if you define it here.
Save	Click **Save** button to confirm your settings.
Cancel	Click **Cancel** to undo your changes.

No escalation notification and no repeat are available for this trigger type.

Add Change Trigger

Define a trigger that is activated by an 'on change' trigger. Some sensors offer the option to send such a trigger whenever sensor values have changed. Click the **Add Change Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Then define settings as described below. Every trigger will provoke one or more notification (s) 2916 to be executed.

CHANGE TRIGGER

When sensor changes perform [...]	Select a notification that is triggered whenever a compatible sensor sends a 'change notification'. You can enable this option in the settings 384 of some sensors. The notification trigger is activated immediately whenever a sensor sends an 'on change' trigger. Choose a notification from the dropdown menu. The menu shows all notifications defined in the Account Settings—Notifications 2916 settings.

There are no other options available for this trigger type.

Sensor Settings Overview

For information about sensor settings, please see the following sections:

- Sensor Settings—384 List of Available Sensor Types 385
- Additional Sensor Types (Custom Sensors) 2778
- Sensor Channels Settings 2782
- Sensor Notifications Settings 2791

Object Settings Overview

For more general information about object settings, please see section Object Settings 188.

Part 8

Ajax Web Interface—Advanced Procedures

8 Ajax Web Interface—Advanced Procedures

The Ajax-based web interface is your access to PRTG. Use it to configure devices and sensors, to set up notifications, as well as to review monitoring results, and to create reports. This web interface is highly interactive and uses Asynchronous Java Script and XML (AJAX) to deliver a powerful and easy-to-use user experience. While you are logged in 138, the PRTG web interface continuously refreshes the data on the screen (via Ajax calls) so it always shows the current monitoring results (you can set 2975 refresh interval and method individually).

Because the web interface works as a Single Page Application (SPA), you rarely see a full page refresh to avoid a performance impact due to redundant processing. Only single page elements are refreshed when necessary. The AJAX web interface shows all object setting dialogs as pop-up layers, so you never lose the current context. This speeds up the user experience appreciably and makes the configuration of objects in PRTG comprehensible. The responsive design of the web interface ensures that it always adjusts to the size of your screen so that you see more information at a glance.

The following sections introduce more advanced procedures in the Ajax Graphical User Interface (GUI).

8.1 Toplists

Packet Sniffer and xFlow (NetFlow, jFlow, sFlow, IPFIX) sensor types can not only measure the total bandwidth usage, they can also break down the traffic by IP address, port, protocol, and other parameters. The results are shown in so-called **Toplists**. This way PRTG is able to tell which IP address, connection, or protocol uses the most bandwidth.

PRTG looks at all network packets (or streams) and collects the bandwidth information for all IPs, ports, and protocols. At the end of the toplist period, PRTG only stores the top entries of each list in its database.

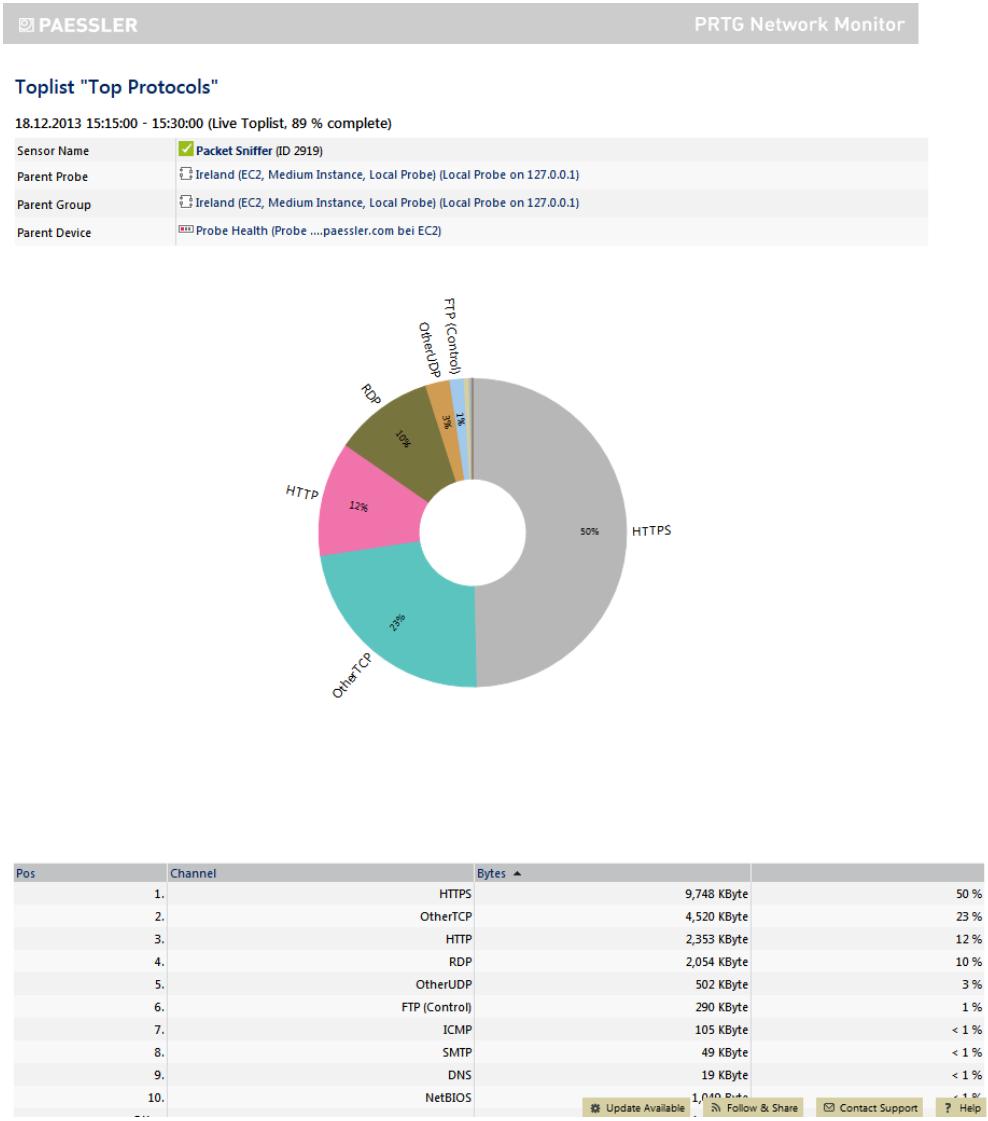
Only Top Entries are Stored

Storing all available analysis data in a database during the analysis process would create a huge amount of data, which would be very slow to transfer between probe and core and also retrieving data would be too slow. By storing only the top 100 entries for short periods of time it is possible to reduce the amount of data to a minimum while still being able to identify devices with huge bandwidth usage.

Toplists Overview

Toplists are available for xFlow, IPFIX, and Packet Sniffer sensors 386 only. Toplist graphs are displayed right on the sensor overview page. By default, there are three different toplists predefined for each sensor:

- **Top Connections**: Shows bandwidth usage by connection.
- **Top Protocols**: Shows bandwidth usage by protocol.
- **Top Talkers**: Shows bandwidth usage by IP address.



Toplist Top Protocols for a Packet Sniffer Sensor

- Click one of these items to view a distribution chart and a list of source and destination IP and port, protocols, kind of traffic in different channels, for example. What kind of information is available depends on the list selected.
- Click an entry in the Toplist periods list on the left side to view data for a certain time span. By default, a time span of 15 minutes is set. You can also manually define start and end time of the Toplist period you want to view. Use the date time picker to enter the date and time. Additionally, several table list options [207] are available.
- To print a Toplist, click the **Print This Toplist** button to view a printer-friendly version. Use the print option of your browser to send it to your printer.
- With **Sensor Overview** you can return to the current sensor's **Overview** tab. For a quick selection of other Toplists of the current sensor, click one of the Toplist icons at the top of the page.
- You can add or delete new Toplists, or edit existing ones on the sensor's **Overview** tab,

Add

Click the **Add Toplist** tile in the sensor overview to create a new Toplist. The available options are the same as for editing 2808 a list.

Edit

Click the small gear icon of a Toplist tile in the sensor overview to modify it.

TOPLIST

Name	Enter a meaningful name to identify the toplist.
Type	▪ **Top Talkers (Which IPs use the most bandwidth?)**: Shows bandwidth usage by IP address. ▪ **Top Connections (Which connections use most bandwidth?)**: Shows bandwidth usage by connection. ▪ **Top Protocols (Which protocols use the most bandwidth?)**: Shows bandwidth usage by protocol. ▪ **Custom (Create your own Toplist)**: Create your own list by selecting criteria below.
Toplist Fields	This setting is only available if you select a custom type above. Select the fields you want to add to the Toplist by adding a check mark in front of the respective field name. The available options depend on the type of sensor used. They are different for Packet Sniffer, NetFlow v5, v9 (and IPFIX), and sFlow. ⓘ For performance reasons, only select the fields you really want to monitor. Please see **Performance Considerations** 2810 section below.
Period (Minutes)	Define the interval for the Toplist in minutes. Please enter an integer value. Toplists always cover a certain time span. Once a time span has passed, the top results are stored and a new Toplist is started. ⓘ To avoid load problems on your probe system, please do not set this interval too long. Default setting is **15** minutes. Please see **Performance Considerations** 2810 section below.
Top Count	Define the length of your Toplist. Only this number of entries will be stored for each period. Please enter an integer value. ⓘ To avoid load problems on your probe system, please set this value as low as possible. Default setting is **100** to store the top 100 entries for each period. Please see **Performance Considerations** 2810 section below.

TOPLIST	
Reverse DNS	Define if you want to do a reverse Domain Name Service (DNS) lookup for IP addresses stored in the Toplist. Choose between: ▪ **Do a reverse DNS lookup for IPs**: Determine the domain name associated with an IP address and show it in the Toplist. ▪ **Do no reverse DNS lookup (faster)**: Show IP addresses only. Choose this option to increase performance.
Probe/Core Data Transfer	Define how the probe sends the Toplist data set to the core server. Choose between: ▪ **According to sensor interval (default)**: Send data in the interval defined in the settings of the sensor for which you create this Toplist. This can create a lot of bandwidth and CPU load with many sniffer sensors, complex traffic, or long Toplists. ▪ **Wait until Toplist period ends (less CPU and bandwidth usage)**: Send data once a Toplist period has finished. This will create less bandwidth usage and CPU load, but you cannot see the current Toplist in the web interface, only Toplists with finished periods. For more information, please see **Performance Considerations** 2810 section below.
Memory Limit (MB)	Define the maximal amount of memory in MB that the probe will use for collecting the different connection information. Every Toplist adds its amount to the probe's memory consumption. Increase this value if the number of captured connections is not sufficient. Please enter an integer value.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Delete

Click the small trashcan icon of a Toplist tile in the sensor overview to delete it. Confirm with **Delete** to delete the list.

Details

Click on the windows symbol to show details of a Toplist.

Performance Considerations

If you create Toplists for data lines with considerable usage (for example, steady bandwidth over 10 Mbit/s) or if the traffic is very diverse (for example, many IPs or ports with only little traffic each) please consider the following aspects:

- The probe gathers all information needed for the Toplist in RAM memory during each period. Only the top 100 entries are transferred to the core. Depending on the Toplist type and traffic patterns, the required memory can grow into many megabytes.
- Choose periods that are as short as possible (especially important when traffic has a high level of diversity) to minimize memory usage.
- Memory requirements can grow almost exponentially with each field used in the Toplist definition (depending on traffic pattern). Avoid complex Toplists for high and diverse traffic. For example, **Top Connections** (5 fields) needs a lot more memory than **Top Talkers** (1 field).
- If you experience high bandwidth usage between core and probe, try to choose the **Wait until Toplist period ends** option in the Toplist settings 2808.
- If you experience Data incomplete, memory limit was exceeded messages, try to increase the memory limit in the Toplist settings but keep an eye on the memory usage of the probe process.
- To increase the performance of a Toplist, disable the reverse DNS lookup.

Notes

- When working with Toplists, be aware that privacy issues can come up for certain configurations of this feature. Using Toplists you can track all single connections of an individual PC to the outside world and you, as the administrator, must make sure it is legal for you to configure PRTG like this.
- Keep in mind that Toplists can be viewed through the web interface. You may not want to show lists of domains used in your network to others, so restrict access rights 129 to sensor types having Toplists.
- Note that diagrams, for example, for top connections are not meant to be used for detailed analysis. Rather they should indicate if there is an uncommon bigger change in this Toplist.

- **Monitoring Bandwidth via Packet Sniffing** 3097

8.2 Arrange Objects

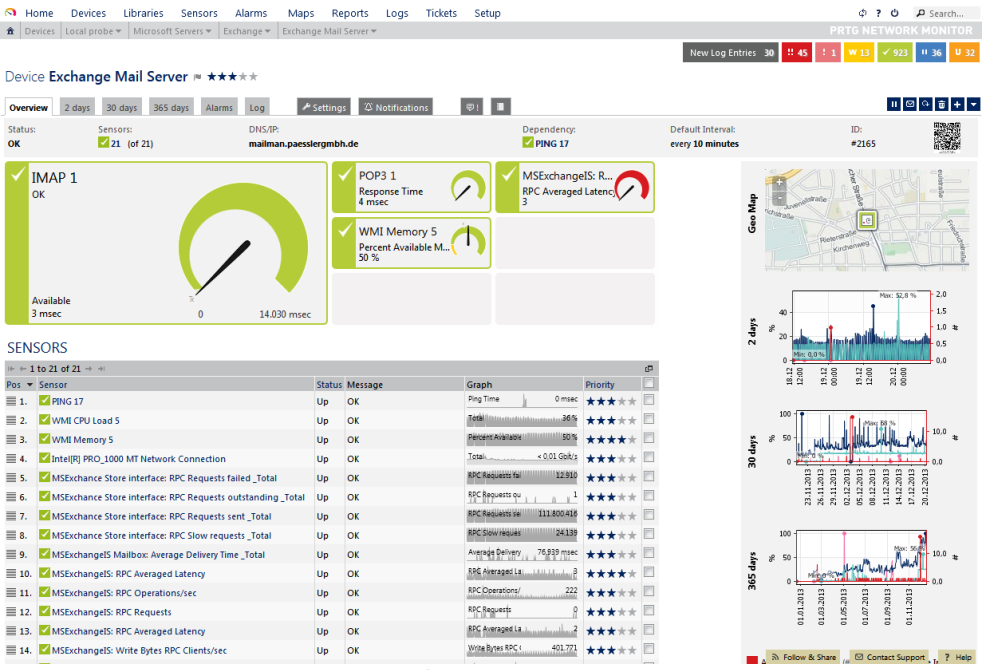
There are several options to move objects within the device tree, or to move objects from one probe or group to another.

Manage Tab in Device Tree

While viewing the device tree (or parts of it), click the **Management** tab to switch to a tree view where you can move monitoring objects using drag&drop in your browser window. For more information, see section Manage Device Tree 292.

Device Details View: Arrange Sensors

When you view the **Overview** tab of a device, you see a list of all sensors on this device.



Arrange Sensors on a Device

Click the column headers **Pos, Sensor, Status,** or **Priority** to re-sort the sensor list. To change a sensor's position, click the small grip at the beginning of the row, drag it to the position you like, and drop it. Changes take effect immediately.

Context Menu: Move

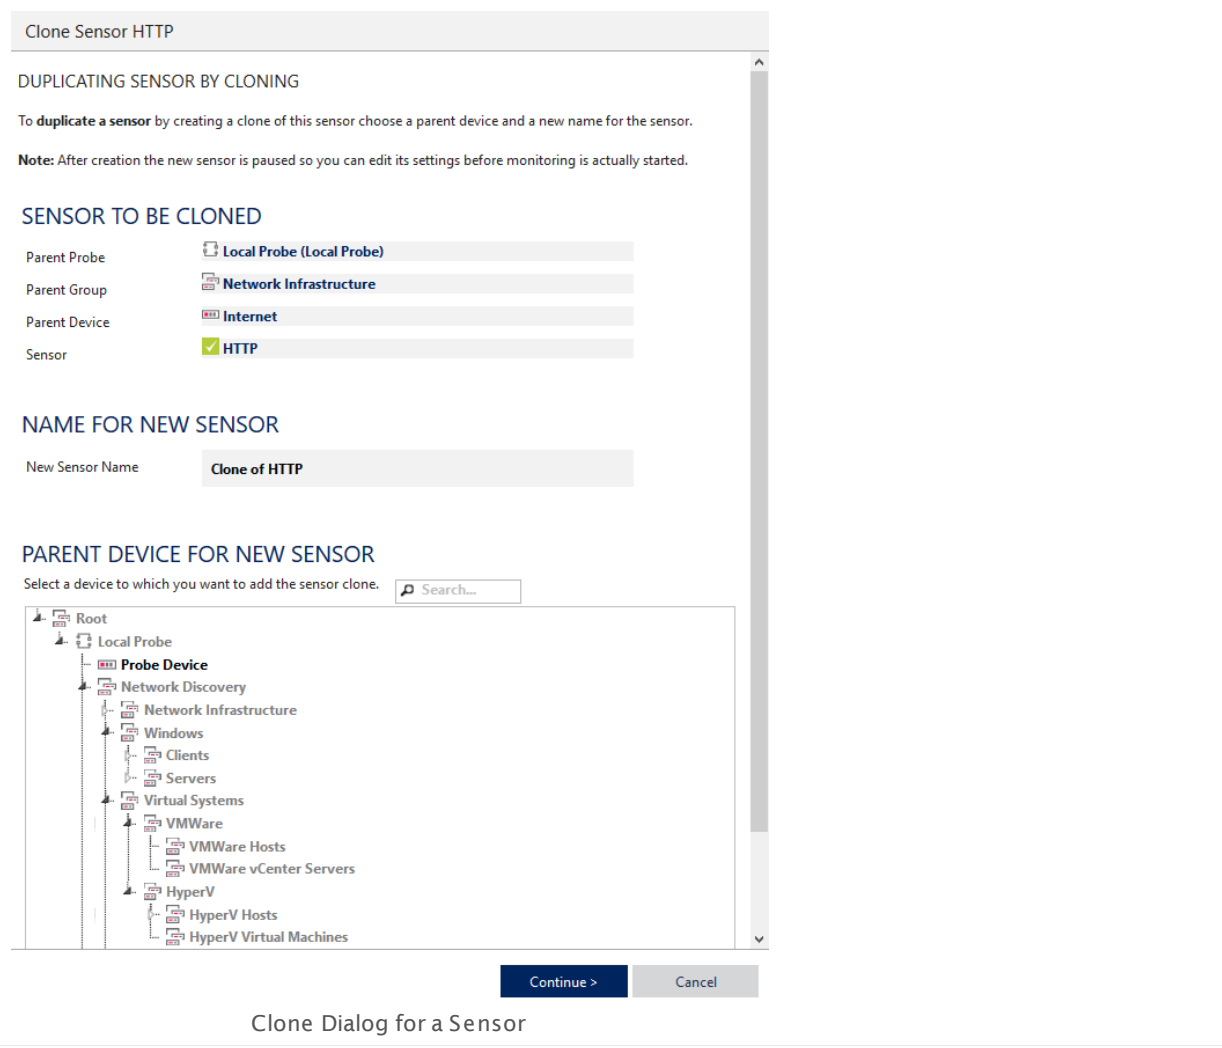
You can also right-click any object in the device tree to show the context menu 215. Select the **Move** entry to move sensors, devices, or groups up and down, or to move groups or devices into other groups or on other probes.

8.3 Clone Object

If you want to duplicate an object with the same settings, you can clone it. Cloning is available for groups, devices, and sensors. Unlike the results when using the **Create Device Template** 2818 option, a cloned device contains all objects of the original device, regardless of whether they bring about working sensors or not. This often depends on the settings of the cloned device.

The new object takes over all settings of the original object. This means, for example, that an **Auto-Discovery** 249 will start automatically on a cloned device (as soon as you resume it) if this option is set on the original device. This may result in sensors appearing twice. To prevent doubled sensors, set **Sensor Management** to **Manual (no auto-discovery)** in the device settings 362 before resuming the clone.

To start, right-click an object in your device tree, and from the context menu 215, select **Clone...** to open an assistant.



Clone Dialog for a Sensor

You cannot clone 'fixed' objects, such as the root group or a probe device.

If you want to clone a sensor, a faster way is to use the **Manage Device Tree** 292 function.

The user account 2975 that clones an object must have at least read access 129 to this object and all objects underneath in the hierarchy 118. The user group of this account must have the permission to create all sensor types 2983 which run on the device or group that is going to be cloned.

Clone Object Settings

OBJECT TO BE CLONED

Object	Several fields show information about the object that you are cloning. The available information varies depending on whether you clone a group, device, or sensor.

NAME OF NEW OBJECT

New Object Name	Enter a meaningful name for the new object to identify it later in, for example, the device tree or lists. By default, PRTG uses the old name with a preceding Clone of.
New IP Address/DNS Name	This field is only available when you clone a device. Enter the IP address or DNS name for the new device.

PARENT GROUP/DEVICE FOR NEW OBJECT

Use the object selector 210 to choose the object that you want to add the object clone to. If you clone a group or device, select a group. If you clone a sensor, select the device you want to add it to.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

The overview 166 page of the new object that you have cloned will open. By default, all sensors are initially paused 214 so you can change settings before monitoring starts. Please check the settings 188 and resume 214 monitoring.

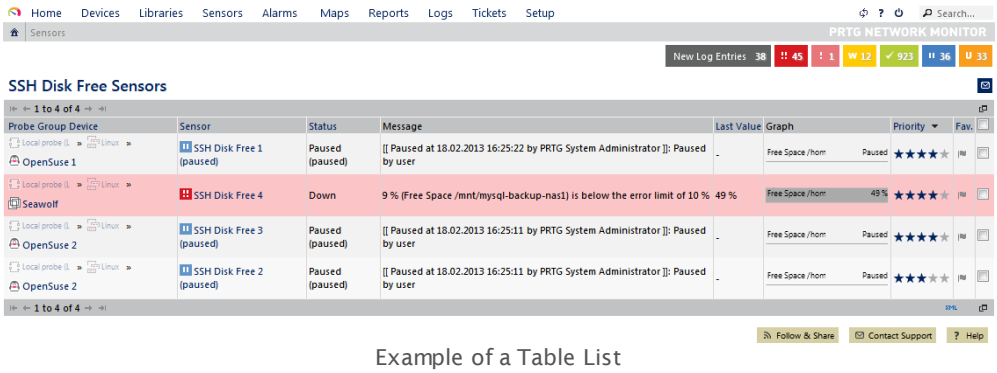
- **Create Device Template** 2818
- **Manage Device Tree** 292

8.4 Multi-Edit

Device and sensor table lists, as well as some other lists, offer multi-edit functionality. With this, you can bulk edit the properties of many objects at a time. Multi-edit is also available in the **Management** tab if you select multiple objects by holding down the Ctrl key (see Manage Device Tree 293).

You cannot change every setting type with multi-edit. PRTG only displays settings that all selected objects have in common.

You cannot multi-edit the standard user groups 2982 "PRTG Administrators" and "PRTG Users Group".

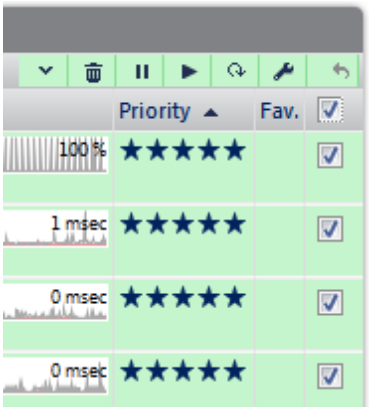


Example of a Table List

Start Multi-Edit in Lists

Start with viewing a table list. For example, choose **Sensors | By Type | ...** or **Devices | Device List | ...** from the main menu bar 231. Table lists are also available in the **Overview** tab of **Libraries** 2845, **Maps** 2885, **Reports** 2862, **Notifications** 2829, and **Schedules** 2938.

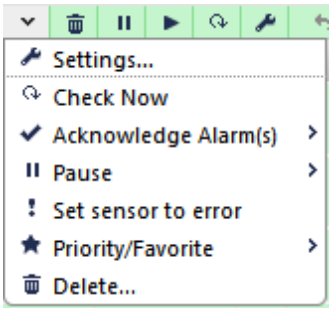
In a table list, start multi-edit by selecting objects using the check boxes on the right. You can also select all objects of the current page at once by clicking the check box in the table header. Use the **Item Count** option to view more items per page. As soon as you select one or more objects, the multi-edit menu appears at the top of the table. Chosen objects are shaded in green.



Multi Edit Menu

Depending on the object type, different functions are available. For example, for sensor lists, some frequently used functions are available as quick buttons, such as **Delete**, **Pause**, **Resume**, **Check Now**, and **Settings**. Click one of the buttons to apply the respective function to all selected objects.

Other options are available in the dropdown menu. Hover over the arrow symbol to show it.



Example of Multi Edit Drop Down Menu

The options in this menu vary depending on the kind of objects selected. Choose an entry to apply the according function to all selected objects.

Once you have selected the objects you want to change settings for, click the wrench symbol to enter the edit settings mode. For available settings, please see below.

Start Multi-Edit in Management Tab

In the device tree, start by clicking the **Management** tab.

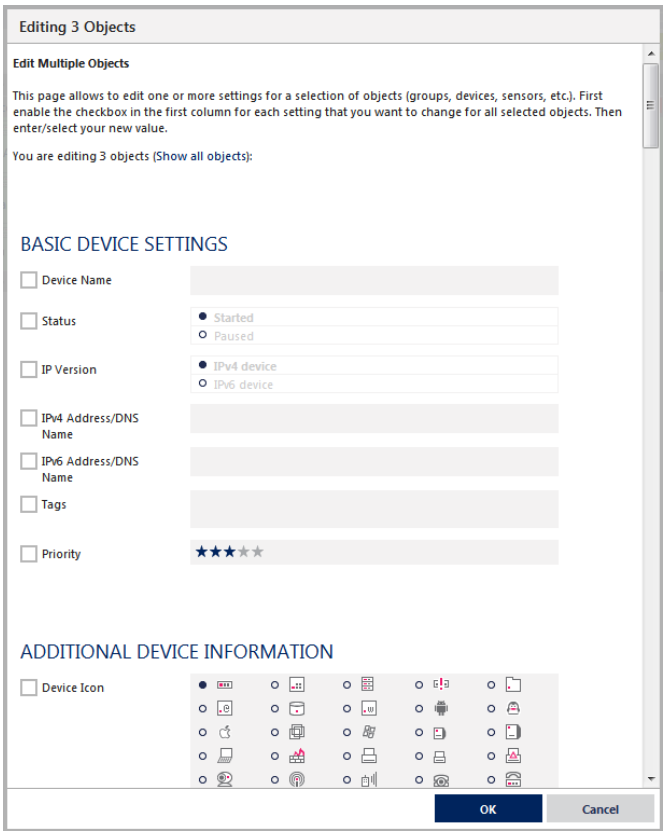
You can use Multi-Edit for object settings:

- Hold down the Ctrl key and select multiple groups, devices, or sensors (one of a kind).
- In the appearing dialog, select the settings you want to edit, change the according values, and click **Save**. The changes will be applied to all selected objects.

For available settings, please see below.

Edit Settings—Settings

The **Edit Multiple Objects** dialog box shows most of the settings that the selected sensors respective devices have in common. For example, you can edit the name, tags, priority, scanning interval, and access rights.



Example of Device Settings in Multi-Edit Mode

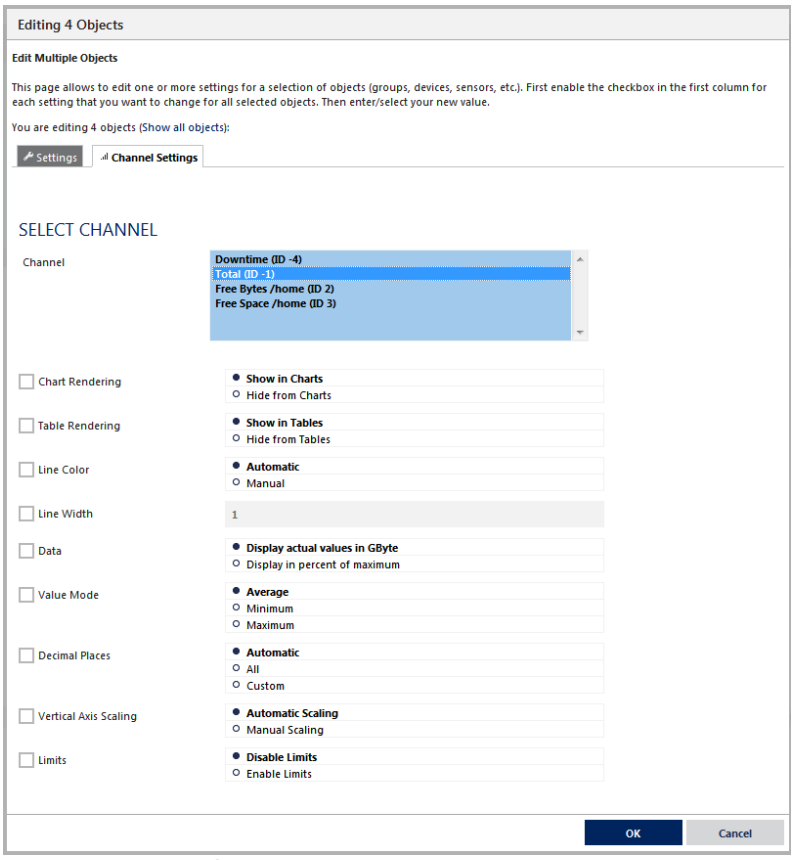
The available options depend on the selected objects and vary according to your selection. When editing multiple sensors, it may be useful to only choose one certain sensor type from the list, so that there are as many settings as possible available for multi-edit.

To change a property, add a check mark in front of the respective line and then change the settings. The new setting(s) will be applied to all objects you selected for multi-edit. All properties that are not activated with a check mark remain unchanged.

Click **OK** to store your settings. If you close the dialog box via the **X** or **Cancel** button, all changes to the settings will be lost!

Edit Settings—Channel Settings

The **Channel Settings** tab in the **Edit Multiple Objects** dialog box is only available when editing sensors. You can edit settings of all channels that the selected sensors have in common. Select a channel name from the **Channel** list. You can then edit display settings, colors, scaling, and limits, for example.



Example of Sensor Channel Settings in Multi-Edit Mode

The available options depend on the selected sensors and vary according to your selection. It may be useful to only choose one certain sensor type from the list, so that there are as many channel settings as possible available for multi-edit.

To change a property, add a check mark in front of the respective line and then change the channel settings. The new setting(s) will be applied to all sensors you selected for multi-edit. All properties that are not activated with a check mark remain unchanged.

Click **OK** to store your settings. If you close the dialog box via the **X** or **Cancel** button, all changes to the settings will be lost!

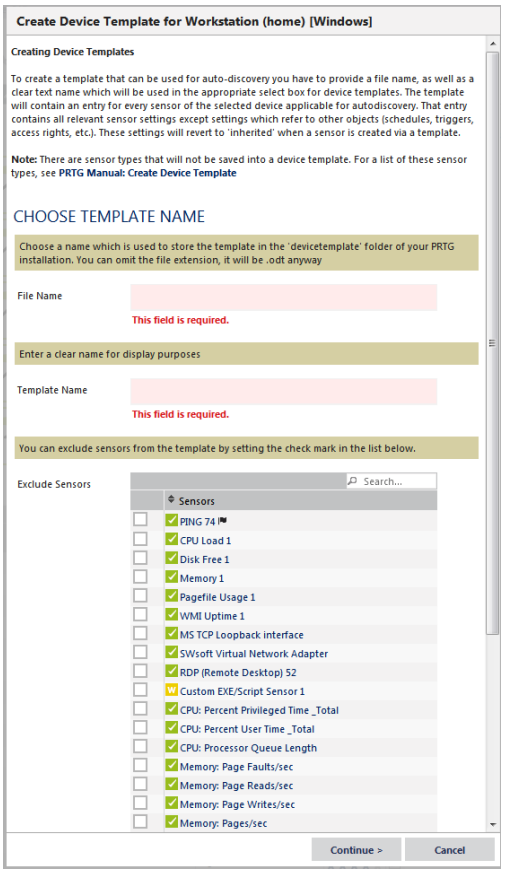
8.5 Create Device Template

If you want to add a certain device several times, you can create a device template from an existing device in your device tree. When creating a device template, PRTG will save information for nearly all sensors on this device to a template file that you can later use in combination with **Auto-Discovery** 249 (restrictions 2820 apply for a few sensor types).

From the sensors, all relevant settings are saved, except settings that refer to other objects, such as schedules 127, notification triggers 2829, and access rights 129. PRTG will automatically revert them to **Inherit**.

To start, right-click a device in your device tree. From the context menu 215, select **Create Device Template...**. An assistant appears.



Create Device Template Assistant

Device Template Settings

CHOOSE TEMPLATE NAME

File Name	Enter a name under which PRTG will store the file. Template files have the extension .odt in the \PRTG Network Monitor \devicetemplates sub-directory of your PRTG core installation 3226 (of the Master node, if in a cluster 116). If a file with this name already exists in this directory, you will see an according error message. The device templates folder is not accessible on PRTG on demand.
Template Name	Enter a meaningful display name for the template as it will appear in the web interface.
Exclude Sensors	Select sensors that you do not want to include into the device template. Mark the corresponding checkboxes of the sensors that you do not want to include into the device template. Sensors that cannot be saved into templates 2820 will not appear in this list. Sensor types that dynamically scan for available monitoring items when you add the sensor to a device will not appear in this list. PRTG includes these sensors automatically into the template if they support template functionality. You cannot exclude them from the device template that you create.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

If your template file was saved successfully, you will see an according message and can review the sensors that were added. Click **OK** to finish. The device template is now stored in the program path of your PRTG core installation. Your device template file contains all sensors, including their settings, of the original device.

During your next auto-discovery, choose the **Automatic sensor creation using specific device template(s)** option and select the name of your newly created device template from the list. PRTG will then try to discover the stored sensor types on the new (or existing) device. If the physical device answers to a sensor request, the sensor is added to the PRTG device. For detailed information, please see **Auto-Discovery** 249 section.

Settings That Are Not Saved

There are a few settings that you cannot save into a device template, so PRTG will set them to default, for example, the Dependency Type setting **Master object for parent** (in **Schedules and Dependencies** section) and Result Handling settings **Write result do disk** (because this is intended for debugging purposes only). Also, settings in the **Access Rights** section are not saved to avoid security flaws.

In general, you cannot save all **Sensor Settings** 384 and **Sensor Channels Settings** 2782 (for example, channel limits) of sensor types that dynamically scan for available monitoring items when you add the sensor. This affects, for example, **traffic sensors** where you can choose interfaces that you want to monitor in the add sensor dialog 288.

Furthermore, due to internal restrictions, the following sensor types will not be saved into a device template:

- **Amazon CloudWatch sensors**
- **Business Process**
- **Core/Probe/Cluster Health**
- **DHCP**
- **Docker Container Status**
- **Dropbox**
- **Enterprise Virtual Array**
- **Google Analytics**
- **Google Drive**
- **IPFIX**
- **IPFIX (Custom)**
- **IPMI System Health**
- **jFlow V5**
- **jFlow V5 (Custom)**
- **Microsoft OneDrive**
- **NetApp cDOT Aggregate (SOAP)**
- **NetApp cDOT I/O (SOAP)**
- **NetApp cDOT Physical Disk (SOAP)**
- **NetApp cDOT System Health (SOAP)**
- **NetFlow V5**
- **NetFlow V5 (Custom)**
- **NetFlow V9**
- **NetFlow V9 (Custom)**

- **Packet Sniffer**
- **Packet Sniffer (Custom)**
- **Passive Application Performance**
- **QoS (Quality of Service)**
- **QoS (Quality of Service) Roundtrip**
- **Sensor Factory**
- **sFlow**
- **sFlow (Custom)**
- **SNMP Trap Receiver**
- **Syslog Receiver**
- **WMI Security Center**

No Update of Device Templates

Once a device template is created, it is not possible to add additional sensors to it via the PRTG web interface. If you want to create a template with an extended set of sensors, please create a new one.

When saving a new device template, all internal IDs of the sensors in this template are updated. Because of this, when you apply a new template to an existing device, PRTG will newly create all sensors that this template contains on this device, even if these sensors were previously created using another device template!

You cannot directly delete device templates.

You cannot edit existing template files on PRTG on demand.

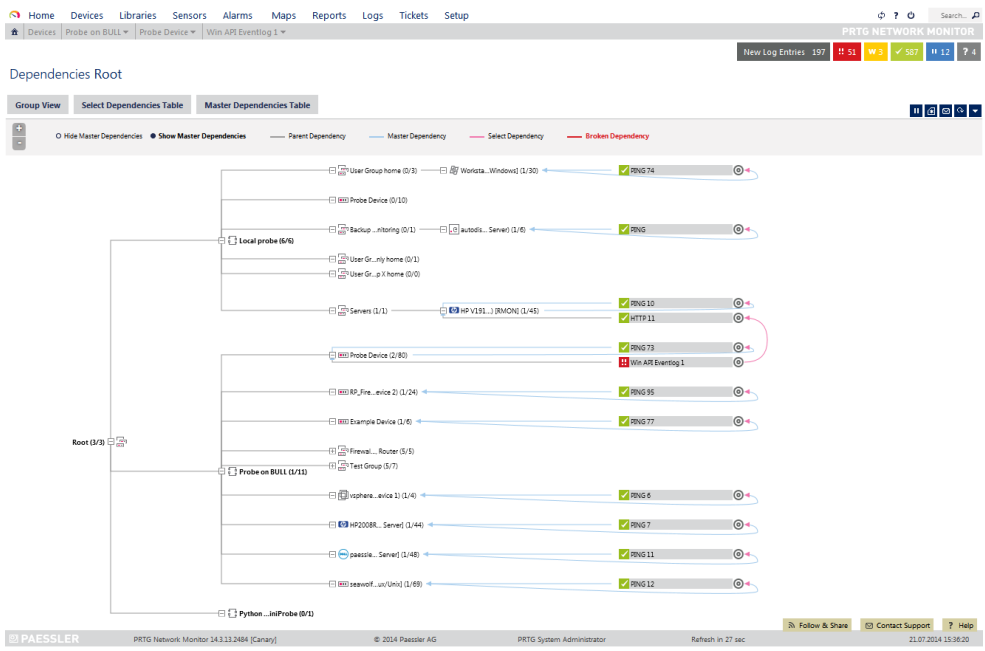
8.6 Show Dependencies

This function shows an overview of the dependencies configured for the objects in your setup. For a general introduction please see the Dependencies 126 section.

In the main menu bar 231, hover over **Devices** | **Dependencies** to show other menu items. Follow the menu path (it is specific to your setup) to view dependencies of the objects in a specific probe or group only.

- **Selected Dependencies** shows a table of manually set dependencies (section Select object in any object's settings).
- **Master Dependencies** shows a table of master dependencies.
- **Dependencies Graph** shows a visualization of device, group, and sensor dependencies. See below 2822.



Dependencies Graph View

Dependencies Graph

Click **Dependencies Graph** to see the device tree in the dependencies graph view with lines of different color connecting objects. Hover over **Dependencies Graph** to show other menu items for the dependency graph (probes and groups). Click a probe or group menu item to show its dependencies directly. The lines in the dependencies graph symbolize dependencies between the monitoring objects in the device tree. Additionally, a color code 2823 is used for the dependencies.

To show the Dependencies Graph, you need to access the PRTG web interface as a **PRTG System Administrator** user.

- Above the graph header bar, you can switch the dependencies view to tables of the currently selected object with the buttons **Select Dependencies Table** and **Master Dependencies Table**. The button **Group View** will show the **Overview** tab 155 of the currently selected object.
- Mark the radio button in the header bar to **Show Master Dependencies**. By default, **Hide Master Dependencies** is selected and only parent, selected, and broken dependencies are shown.
  These buttons are not available in Internet Explorer for technical reasons. Please use Google Chrome 57 or later (recommended) or Mozilla Firefox 52 or later.
- Click the + or — buttons on the left in the header bar to zoom in or out of the graph.
- Click probe and group nodes to show the respective dependencies.
- Click device or sensor nodes to open the corresponding overview tab.
- Click the + or — boxes to expand or collapse probe and group nodes.
- Numbers in parentheses indicate how many child nodes of an object are shown.
- The **Highlight Connection** buttons to the right of sensors show the corresponding dependency line and parent and dependent objects in bold.

Color Code of Dependencies Graph

The line's colors show the kind and source of a dependency. This represents the **Dependency Type** as defined in the **Schedule, Dependencies, and Maintenance Window** settings of a probe, group, device, or sensor 248.

You can find the color legend also in the graph header bar.

- **Gray**
  Gray lines show a dependency by inheritance (Use parent). The source of the dependency is the parent object on the left end of the line, for example, Root is the parent of Local Probe.
- **Pink**
  Pink lines show a dependency that was set manually (Select object). The source of the dependency points to the dependant with a pink arrow at the line's end.
- **Blue**
  Blue lines show a master dependency for a device (Master object for parent). The sensor that is set as the master points to the dependent device with a blue arrow head at the line's end. The arrow head from the dependent device to its master object is pink.
- **Red**
  Red lines indicate broken dependencies, for example, if the master is not available.

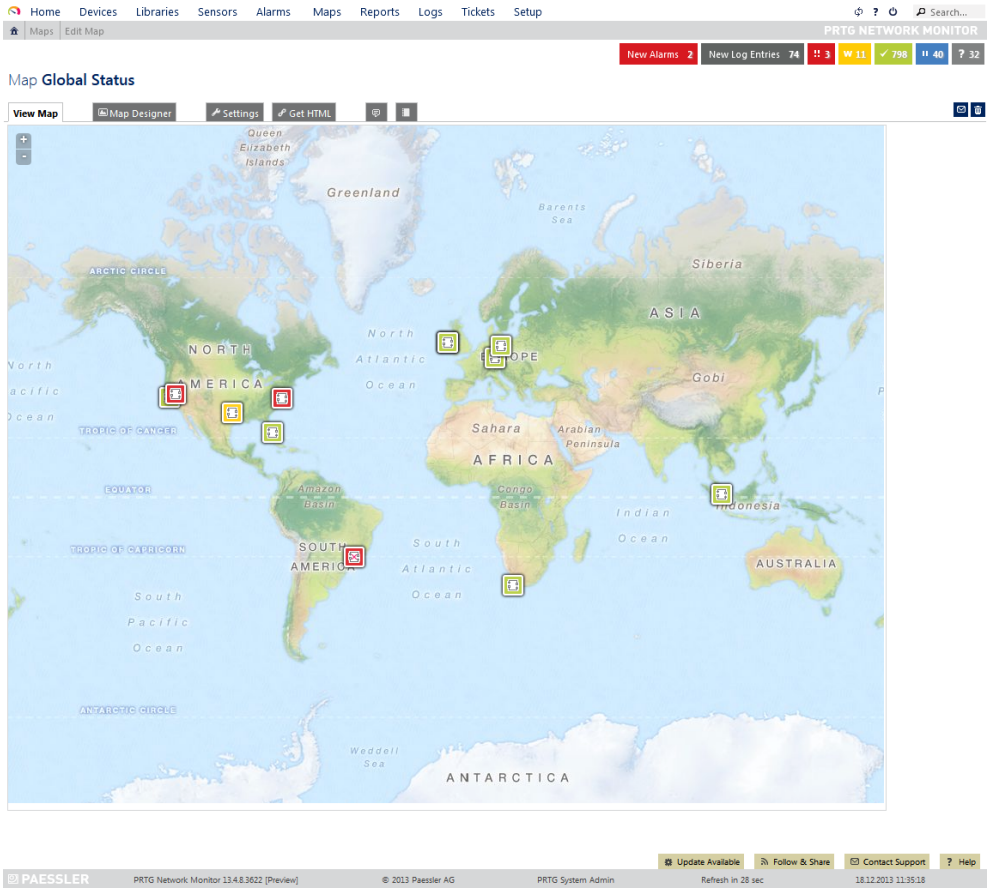
8.7 Geo Maps

With the PRTG Geo Maps feature you can visualize geographical information about your monitored objects. You can display the location of probes, groups, and devices in a graphical map on the details page of an object, or on PRTG **Maps** 2885. This feature is especially useful when you monitor networks that are spread over several different locations. Devices located in a few cities of a country or various continents can all easily be visualized.

You can enter **Location** information for each probe, group, and device. PRTG uses the first line of this information to query a geographical map that shows your objects. Your location specification is resolved to global geographical coordinates by the PRTG core server with the help of an external map service provider.

PRTG connects to the specified maps provider to get map tiles. The map tiles provide the (geo) graphical "background". Then PRTG marks the defined locations with the corresponding object icons and their status 2826 on the map. You can select your favorite map tiles provider in **System Administration—User Interface** 2945 (setting **Geo Maps**).

You can display geographical maps on the device tree. PRTG adjusts the zoom of a map automatically so that it can show all locations of a selected object. You can also add geographical maps to PRTG **Maps** 2885. To do so, open the PRTG **Map Designer** 2893 (either in an existing map or create a new one) and click **Geo Maps** in the properties menu on the right.



The Global Status of a Network in a Geo Map

Using Geo Maps

To use geographical maps within the PRTG web interface 136 or **Enterprise Console** 3028, please ensure the following:

1. In the system administration in the PRTG web interface, select the maps provider and type you want to view. There, you will also find an option to disable geo maps integration if you do not want to use it. See section **System Administration—User Interface** 2945 (setting **Geo Maps**) for detailed information.

2. In the settings of a monitoring object 188 (probe, group, device), add a city name, address, or coordinates in the first line of the **Location** field. When you view the details of this object, PRTG will show a geographical map. PRTG uses the **Location** information also when you view objects in the **Enterprise Console** 3028 or add **Geo Maps** objects to PRTG **Maps** 2885.

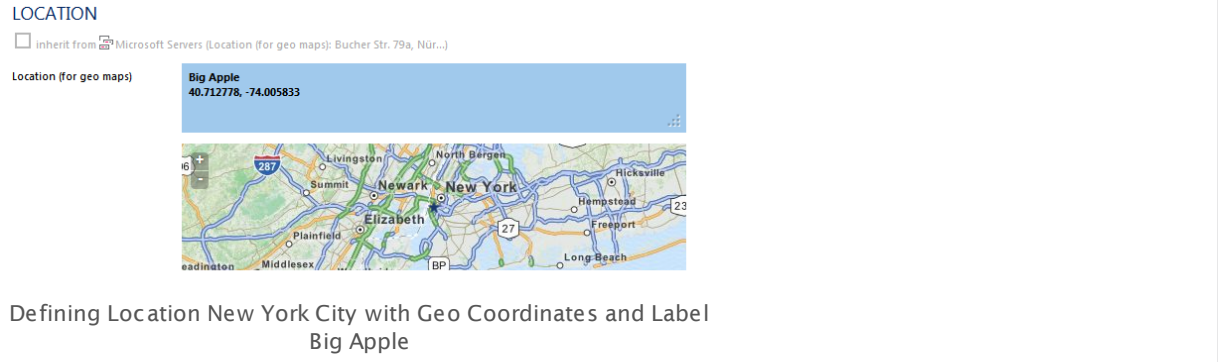
3. Make sure your PRTG core server has access to the internet to obtain map tiles. If a proxy is mandatory in your network, configure proxy settings accordingly. For details, please see **System Administration—Core & Probes** 2967. For details about tile server domains, please see this Knowledge Base article: Which domains and ports does the GeoMaps feature use?

Labeling Locations

You can define your own labels for locations of objects. To do so, enter the desired label in the first line of the **Location** settings and provide the geo coordinates of the location in the second line. This object will appear with the defined label in PRTG geo maps.

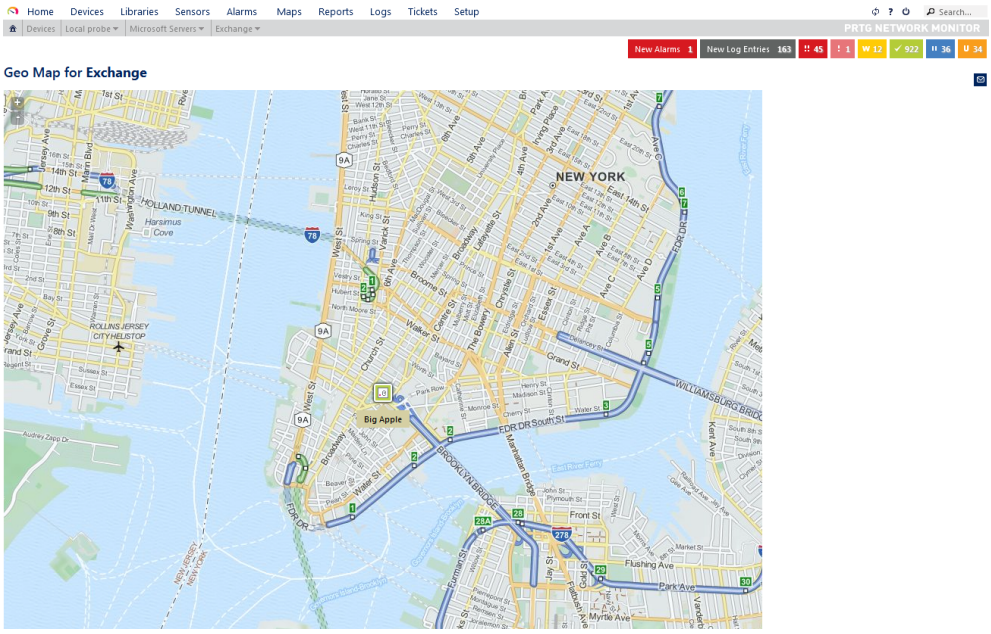
For example, add the following to the location field:

```
Big Apple
40.712778,-74.005833
```



Defining Location New York City with Geo Coordinates and Label Big Apple

The location New York City appears the with the label Big Apple:



Location New York City with Label Big Apple

It is also possible to define the same label for different locations. For example, imagine your company's headquarter is spread over several different locations. For each object representing a dedicated headquarter in the PRTG device tree, enter its coordinates in the second line of the respective **Location** settings and the label "Headquarter" in the first line. All corresponding objects will be displayed as "Headquarter".

This way, you can easily find your desired objects on the map.

Map Icon Colors

On the geographical maps the different location icons show the overall status 163 at this location by using a color code. Following, you can see all possible location states in order of their hierarchy:

Flag	Flag Color	Location Status	Meaning
	Red	**Down**	At least one sensor at this location shows a red **Down** status. Hover the circle with the letter symbol in the legend to view the total number of alarms at this location.
	Bright-Red	**Down (Acknowledged)**	At least one sensor at this location is **Down** and a PRTG user acknowledged this status with the **Acknowledge Alarm** function. The **Down** states of all sensors at this location must be acknowledged—if at least one sensor is unacknowledged down, this location will be displayed as **Down**.
	Yellow	**Warning**	At least one sensor at this location shows a yellow **Warning** status. There is no sensor in a **Down** or **Down (Acknowledged)** status at this location.
	Orange	**Unusual**	At least one sensor at this location shows an orange **Unusual** status. There is no sensor in a **Down**, **Down (Acknowledged)**, or **Warning** status at this location.
	Green	**Up**	All sensors at this location are in a green **Up** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Paused**, or **Unusual** status at this location.
	Blue	**Paused**	All sensors at this location show a blue **Paused** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Unusual**, or **Up** status at this location.
	Black (Grey)	**Unknown**	All sensors at this location have an **Unknown** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Unusual**, **Paused**, or **Up** status at this location.

For detailed information about sensor states, please see the section **Sensor States** 163.

Geo Tracking of Your Mobile Device

It is possible to show the location of an Android device and track its movements on PRTG Geo Maps. PRTG can draw the route a device has taken directly into geo maps. For this feature, you need the PRTG Mobile Probe for Android.

For details, see this Knowledge Base article: How can I track geo data of my Mobile Probe device?

8.8 Notifications

PRTG uses notifications to send you alerts whenever PRTG discovers a defined status, such as slow or failing sensors, or when sensor channels breach threshold values. You can define an unlimited number of notifications allowing to use one, or more, of several communication channels like email 2922, text messaging 2924, push notifications 2923 to Android and iOS devices, and many more 2921. PRTG sends notifications to the desired user's **Notification Contacts** 2934 that you can define for each user account of your PRTG installation.

See also our video tutorials for notifications:

- Video Tutorial: Use Cases for Notifications
- Video Tutorial: How to Set Up and Use Notifications in PRTG

Overview

PRTG sends a notification when a defined event evokes it. The following events can trigger notifications:

- **Sensor status changes**
  For example, when a sensor changes status to **Down** or **Warning**, if responses are slow, or sensors show an **Unusual** status.
- **Sensor value threshold breaches**
  For example, when a sensor shows a request time higher than 1,000 ms for more than 30 minutes, or when free disk space is below 10%.
- **Speed threshold breaches**
  For example, when a traffic sensor shows more than 1 Mbit/s for more than 5 minutes.
- **Volume threshold breaches**
  For example, when a traffic sensor shows more than 1 Gbyte transferred in 24 hours.
- **Sensor value changes**
  For some sensors you can trigger a notification whenever the value changes, for example, when monitoring files on a hard disk drive.

A notification can be one of these actions:

- Send Email 2922
- Send Push Notification 2923
- Send SMS/Pager Message 2924
- Add Entry to Event Log 2926
- Send Syslog Message 2927
- Send SNMP Trap 2928
- Execute HTTP Action 2929
- Execute Program 2930
- Send Amazon Simple Notification Service (SNS) Message 2930
- Assign Ticket 2931

For details, see section **Account Settings—Notifications** 2921.

Usually there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always add two different ways to get a notification. For example, use the latency setting of a state trigger 2793 to choose a notification with another delivery method than in the first trigger condition, or set up a second trigger with another notification for the corresponding object.

Notifications can contain valuable sensor information, such as:

- Last error message
- Last good/failed request
- Total downtime
- Total uptime
- Recent sensor history
- A direct link to the web interface

For available placeholders, see this Knowledge Base article: What placeholders can I use with PRTG?

Notifications Setup

Overall, you have to go through four steps to use notifications with PRTG. Please go through all of them for a first setup:

1. Check and set up the **Notification Delivery** settings. This tells PRTG how to send messages.
   For detailed information, see **System Administration—Notification Delivery** 2961.

This only applies to PRTG on premises instances, not to PRTG on demand.

2. Check and set up Notification Contacts for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** 2934.

3. Check and set up several **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** 2916.

4. Check and set up **Notification Triggers** for objects. These provoke the defined notifications.
   For detailed information, see **Sensor Notifications Settings** 2791.

We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2922 and one SMS notification 2924. If delivery via email fails (due to a email server outage or for other reasons), PRTG can still notify you via your smartphone in this case as a fallback. You can achieve this, for example, by using the latency setting in a state trigger 2793 and selecting a notification with another delivery method than for the first trigger condition.

Please see the sections **Setting Up Notifications Based on Sensor Limits: Example** 2832 and **Setting up Notifications Based on Libraries: Example** 2840 for a step-by-step guide that describes a potential notifications setup.

There are also custom notification scripts available in the PRTG Script World.

More

- https://kb.paessler.com/en/topic/373

Knowledge Base: Notifications based on priorities

- https://kb.paessler.com/en/topic/31243

8.8.1 Setting up Notifications Based on Sensor Limits: Example

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

This section shows you exemplarily how to set up a notification for exceeded disk free limits. We provide the approach for this specific use case step by step so you can adapt it to define limits and corresponding notifications for other sensor types.

You have to take several steps to set up notifications based on limits:

- Step 1: 2832 Provide necessary information about the delivery of notifications (SMTP and SMS).
- Step 2: 2833 Specify recipients for notifications for each user account of your PRTG installation.
- Step 3: 2833 Create notifications, specifying the type of notification and its content.
- Step 4: 2834 Define thresholds that change a sensor's status (this is not necessary for every kind of notification).
- Step 5: 2837 Add suitable triggers to objects which evoke notifications if something is going wrong in your network.
- Step 6: 2837 Test if the created notification is triggered and delivered correctly.

When you set up your own notifications, you do not necessarily need to go through all the steps we describe here. In this section, our main goal is to give you a general idea of the notifications concept.

Step 1: Setting up the Notification Delivery

Before creating your actual notifications, you first have to define how those notifications are delivered to your email account, mobile phone, or pager. To do so, choose **Setup | System Administration | Notification Delivery** from the PRTG main menu bar. Specify the mechanism of SMTP delivery, sender email and name, as well as the HELO ident. For SMS delivery, select your service provider and provide the corresponding credentials.

You can find details about notification delivery in section **System Administration—Notification Delivery** 2961.

This only applies to PRTG on premises instances, not to PRTG on demand.

Step 2: Setting up Notification Contacts

Create notification contacts to define where you want receive notifications. Recipients can be email addresses, phone numbers (PRTG on premises only), or push devices (Android or iOS devices, or Windows Phone, with the corresponding PRTG smartphone app 3082). You can define as many recipients for each user account in your PRTG installation as you want. By default, the recipient "Primary Email Address" is available—this is the email address you provide in your account settings 2909. This is sufficient for a first setup of notifications. Later on, when you see how it works, you can define more contacts. When you add a notification to a device, you just have to select a user or user group as recipient then and PRTG uses the according contacts you define here.

For details, see section **Account Settings—Notification Contacts** 2934.

Step 3: Setting up the Notification's Content

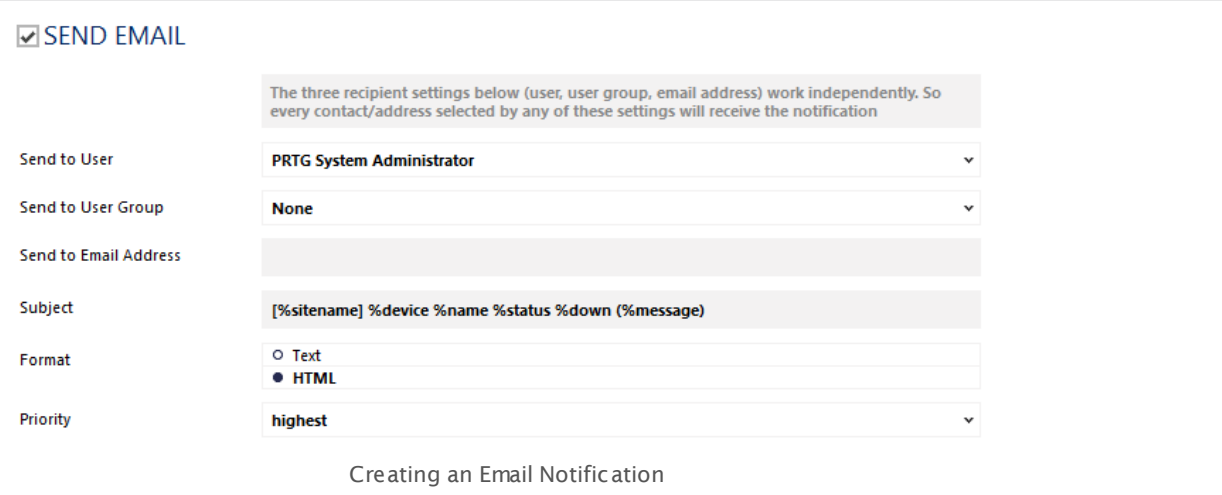
To get an informative message when a disk is running out of capacity, create a corresponding notification. Choose **Setup | Account Settings | Notifications** from PRTG's main menu bar and click on the button **Add New Notification**. Give the notification an explanatory name; in our case you could use Disk Free Limit Notification. However, if you want to trigger this notification on a global level (for example, for a probe or group) such that it would not only apply to breached disk free limits, a general name would be more suitable (like the predefined notification "Email to Admin"). If you leave the default text of the newly created notification, it already contains all necessary information, for example:

- which sensor is affected,
- since when the sensor is affected,
- last value of this sensor.

See section **More** 2838 for the other options you have here.

After providing this basic information, select the delivery method. In our case, we choose **Send Email** for this notification by marking the corresponding checkbox. Specify who will receive the notification (select a specific user, for example, and PRTG sends the notification to all contacts of this user you specified in step 2 2833), its subject, the format, and its priority. By default, the email notification contains several information parameters about the evoking sensor: its name, status, time, message, location in the device tree, etc.

You can choose any other notification method, of course. Please see **Account Settings—Notifications** 2921.



Creating an Email Notification

Once you set up the notification completely, click **Save**. PRTG opens the notifications overview page again. You can now use this notification for every trigger on every object in your device tree.

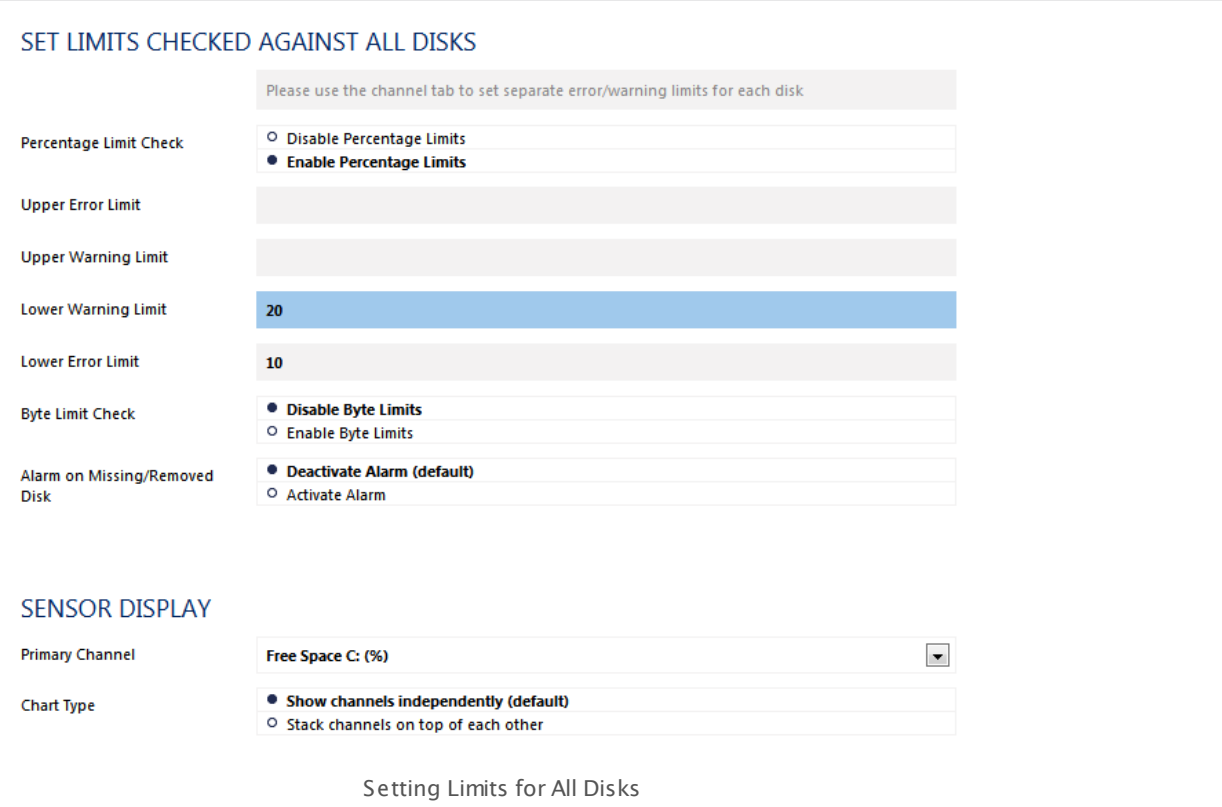
Step 4: Define Limits

Before creating triggers that evoke notifications, first specify the limits which you want to apply to your disks. For example, if you want to get a notification when a disk has exceeded 80% of its capacity, force the sensor into a **Warning** status at this utilization. You have several options to set limits for disk free sensors:

- Set limits checked against all disks in the settings of multi-drive sensors: **WMI Free Disk Space** 2573, **SNMP Linux Disk Free** 1924, **SSH Disk Free** 2170
- Enable limits in **Sensor Channels Settings** 2782 of single sensors.
- You can achieve both with **Multi-Edit** 2814.

Step 4.1: Define Limits in Sensor Settings (Multi-Disk Free Sensors Only)

You can set limits for sensors monitoring multiple disks directly via the **Settings** tab on a sensor's details page. **Multi-Edit** 2816 for existing sensors is also possible. Open the settings of the selected sensor(s) and go to section **Set limits checked against ALL disks**. There, for example, enable **Percentage Limit Check**. In the field **Lower Warning Limit**, enter the percentage suitable to your needs. In our example, this would be **20**. Alternatively, you can use bytes to define a limit. However, we recommend using percentage values for more flexibility. This limit applies to all channels of this sensor that represent disks.



Setting Limits for All Disks

This sensor setting is only available for multi-drive sensors. You can omit Step 4.1 for all sensors that are not from the type "disk free".

Step 4.2: Define Limits for Sensor Channels

To set specific limits for single disks, use the sensor's **Channel** settings. You can open channel settings via the gear icon in the respective channel gauge or in the channels table. **Enable Limits** at the bottom of the channel settings dialog and specify your desired limits in the **Lower Warning Limit** field. This limit only applies to the respective channel.

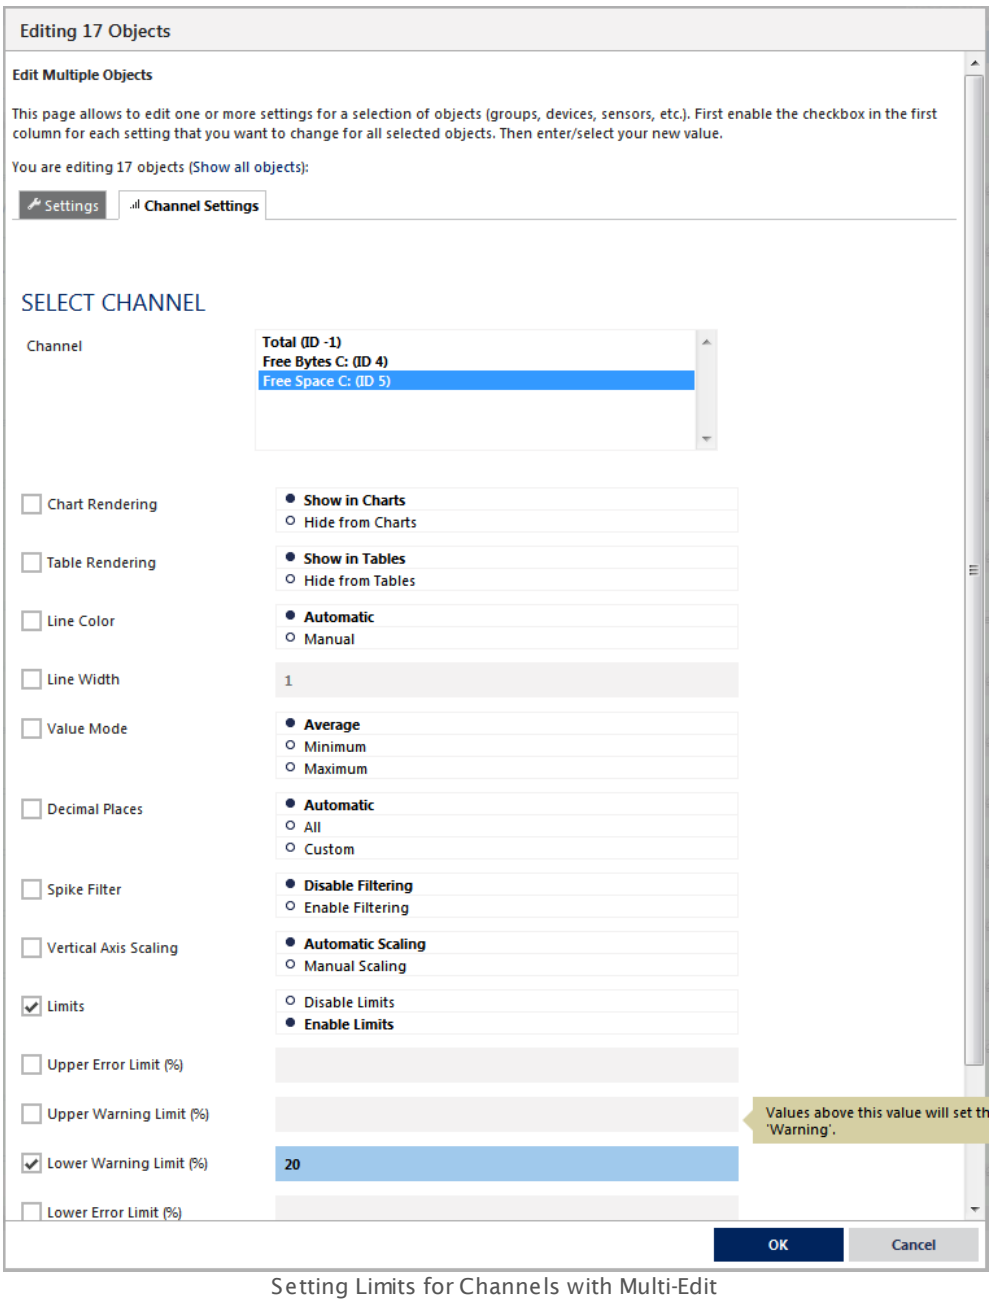
If you define channel limits when using the sensor's limit setting in the sensor's **Settings** tab at the same time, the first limit that applies will be considered. This way, you can individually define harder limits for single disks in a multi-disk sensor. All defined limits are valid side-by-side.

You have to take the approach via channel settings for sensor types that monitor only one (logical) disk, for example, the **SNMP Disk Free Sensor** 1757. For these sensor types, you can use **Multi-Edit** 2817 if you want to apply the same limits for each of these sensors automatically.

- To see all sensors of this type at a glance, just filter for it: From PRTG's main menu bar, choose **Sensors | By Type | SNMP Disk Free**.
- Mark the checkboxes of the sensors you want to add a limit for.
- Click the wrench symbol in the multi-edit bar.
- Open the **Channel Settings** tab.

- Select the channel you want to add a limit for; in this case it would be most likely the channel **Free Space**.
- Then **Enable Limits** at the bottom of the dialog and enter the number in the correct field as described above.

When you are done, save these settings—the new limit applies to all channels with this name of the multi-edited sensors.



Setting Limits for Channels with Multi-Edit

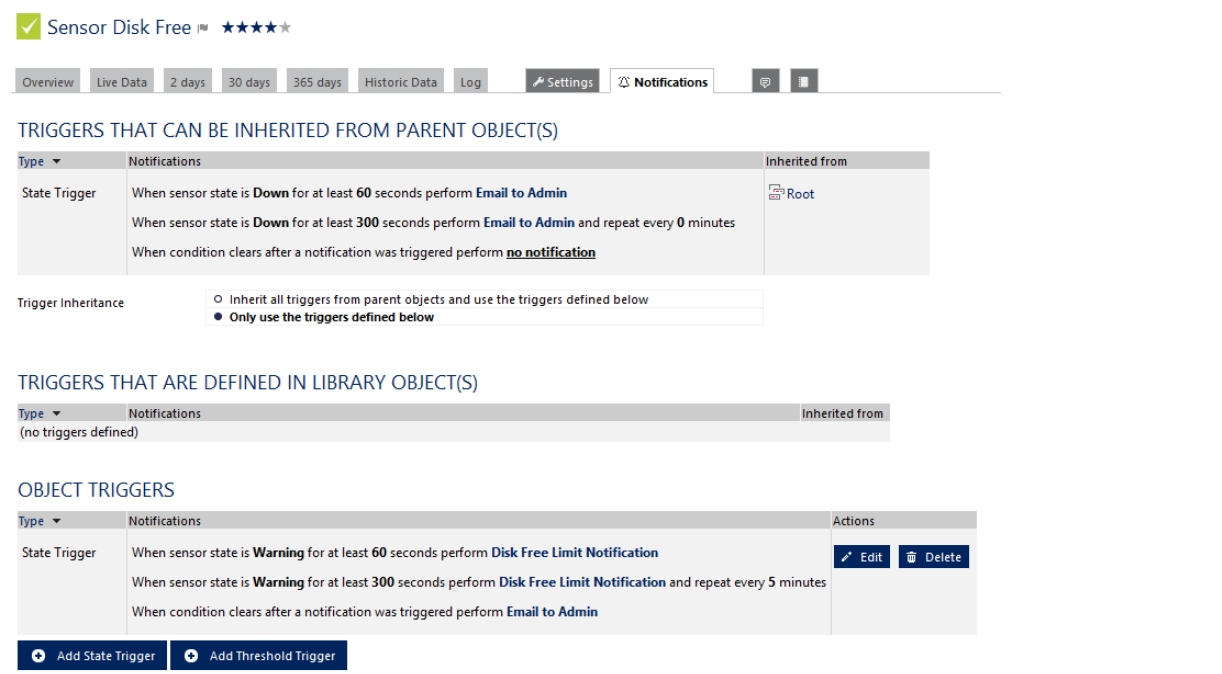
Step 5: Setting up the Notification Trigger

You specified limits to define when a sensor will go into a **Warning** (or **Error**) status. Now you can create the according triggers. The trigger we use in this example is the **State Trigger**.

For details about other possible notification triggers, see section **More** 2838.

- You can set up a **State Trigger** on any level in your device tree. For example, open a group containing the device(s) representing your disks.
- Open the **Notifications** tab.
- Click **Add State Trigger**.
- Set the trigger to "When sensor is Warning" and choose the notification you created before ("Disk Free Limit Notification" or a more general one) from the drop down list.
- Adjust the other notification settings to your needs and save this new object trigger.

Now you receive a notification immediately when the capacity of one of your disks falls below the defined limit, in this case 20% free disk space.



Setting a Trigger for Disk Free Limit Notification

Step 6: Testing the Notification

Finally, test the notification that you created. You can trigger this notification for test purposes immediately:

- From the main menu bar 231, choose **Setup | Account Settings | Notifications**.
- For the respective notification, click on the corresponding **Test** button.

Then, check if the notification was triggered and delivered correctly, depending on the delivery method you defined before. If you do not get a notification (or a defined action is not executed) at all, check the notification logs: From the main menu bar, choose **Logs | System Events | Notifications**. Look for the triggered notification in the table list (verifying that the notification delivery is set up correctly in general) and consider the corresponding message. See section **Logs** 198 for more information.

More

This section provides information about additional options you have when working with notifications.

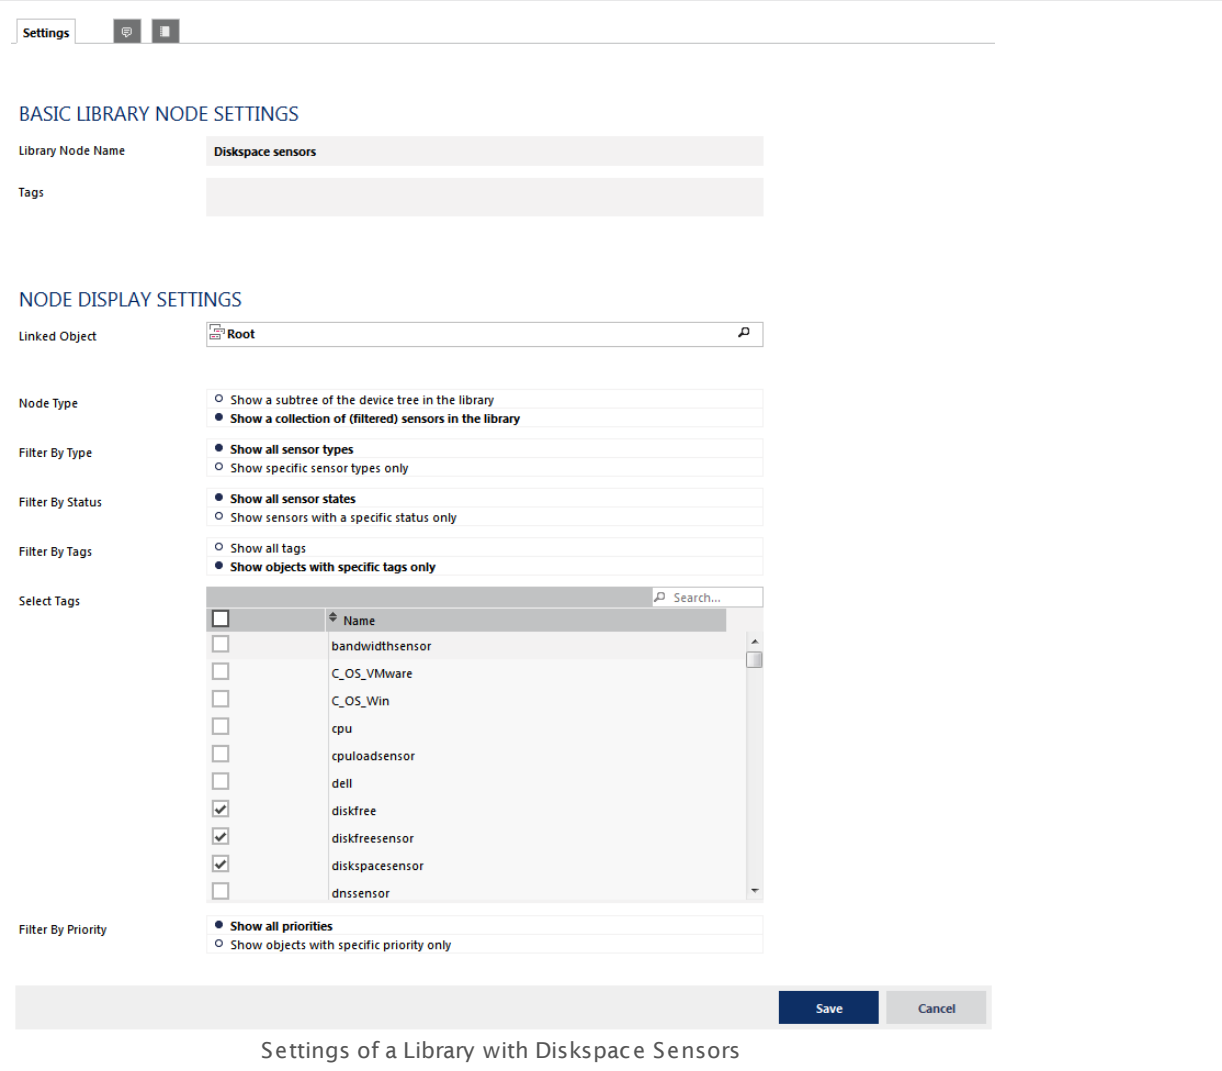
- **Notification Settings:**
  You can create schedules to activate notifications only at specific times, for example, only on weekdays. In section **Notification Summarization** you can choose between various options to avoid message floodings. Furthermore, define which user groups will have access to edit this notification. For details about notification settings, refer to section **Account Settings—Notifications** 2916.

- **Content of Emails:**
  You can individually adjust the subject, header, and footer of emails to your needs. See section **Account Settings—Notifications** 2921 for details about editing the subject. The article How can I include my own logo into HTML emails? in the Knowledge Base explains how to edit the header and footer of emails.

- **Other Triggers:**
  An alternative to the state trigger would be to add a **Threshold Trigger**; then you would not need to set up limits explicitly, though, this trigger type would only be suitable for disk free sensors when using the trigger for single sensors, one by one. Free disk sensors have free space in percent as primary by default, other sensors have primary channels with the units bytes or seconds. However, threshold triggers only apply to the primary or total channel. General notification triggering by threshold might not work as expected for sensors of the "percentage" type. You can find all available triggers in section **Notifications** 2829.

- Add a **Threshold Trigger** to a sensor directly:
  Go on a sensor's detail page and select the **Notifications** tab. Click on **Add Threshold Trigger**, select the desired channel, and provide the condition when this notification will be sent. In this example for free disk space, the setting would be "When Free Bytes C: (%) channel is Below 20 for at least 60 seconds perform Disk Free Limit Notification".

- **Notifications with Libraries:**
  If your disk devices are spread over many groups, we recommend that you use a PRTG library 2845 for your disks. Choose **Libraries | All diskspace sensors** from the main menu bar, go on the **Notifications** tab, and add a state trigger as described above.
  Not all disk free sensor types might appear. You can add them to this library in the settings of the library node. There you can filter by type or tag 2855 and add missing sensors this way. You can also filter by priority and other sensor properties.



Settings of a Library with Diskspace Sensors

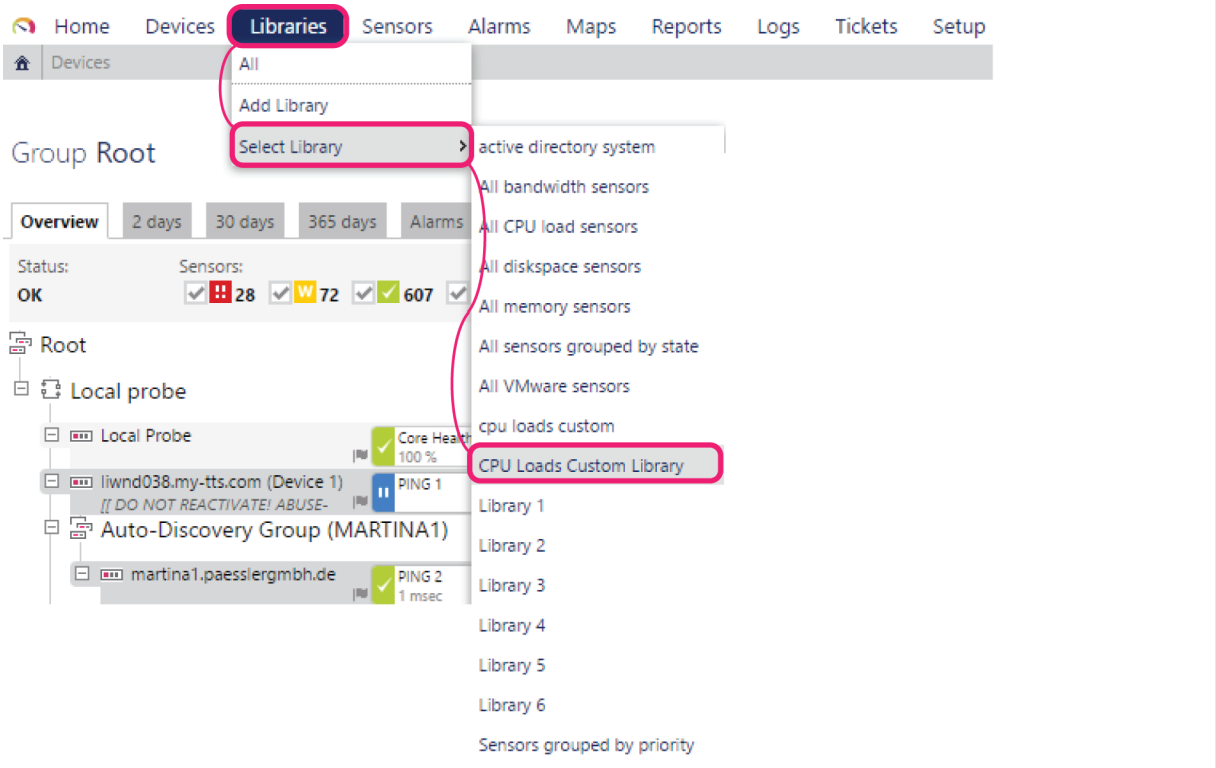
8.8.2 Setting up Notifications Based on Libraries: Example

What's so special about notifications set to whole libraries instead of single sensors? How do I set up libraries, and how do I get the most out of my library notifications?

This section describes how you can reorganize your devices or sensors by their function, and thereby create a new customizable view. This way you can monitor entire sections of your network with a single set of notifications [2829].

You can personalize these views and their notifications for your own use. Furthermore, you can grant and restrict permission to this view to other PRTG users or PRTG user groups, to give them direct access to some of the information in PRTG. By using libraries, you can make your notification management faster, easier, more powerful, and more refined.

Step 1: Setting up a New Library



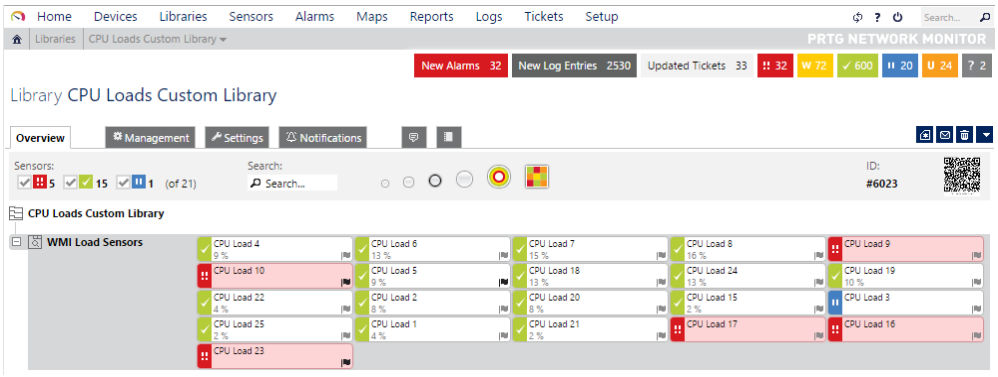
Creating a new library

Click here to enlarge: https://media-s3.paessler.com/prtg-screenshots/Setting-up-notifications-based-on-libraries_3.png

Create a new library:

- Select **Libraries** from the main menu bar and click **Add Library**.
- Give the library a meaningful name. Possibly add some **Tags** [124] for easier organization.
- Optionally, assign access rights to your predefined user groups.

- Click **Continue** to create the new library.
- The **Management** tab of the library opens.



Library overview tab

Click here to enlarge: https://media-s3.paessler.com/prtg-screenshots/Setting-up-notifications-based-on-libraries_4.png

Add objects to your library:

- Click the **Add Library Node** button.
- The **Add Library** dialog opens.
- Define the **Node Display Settings**:
  - Choose a node from which the sensors will be taken (predefined: **Root**).
  - Select **Show a collection of filtered sensors in the library (max. 1000)** to filter (the subtree) further.

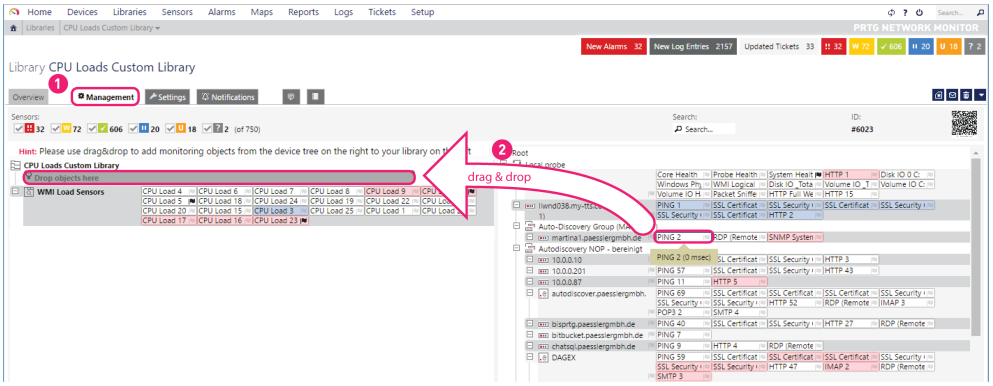
Choose from following filter criteria:

- **Show specific sensor types only:** Add checkmarks to sensor types you want to include.
- **Show specific sensor types only:** Add checkmarks to sensor types you want to include.
- **Show sensors with a specific sensor status only:** Choose from up, warning, down, or unusual.
- **Show objects with specific tags only:** Enter tags to include certain sensors.
- **Show objects with a specific priority only**: Priority "1" through "5" is possible.

The libraries are dynamic not static. When you add or remove sensors to your device tree that are of a type already specified here, the library will automatically update the displayed sensors. The same is true for the other three categories.

- Confirm via **Continue**.
- The new library node appears.

You can rearrange the nodes in any sequence you require. To manually add objects from the device tree, proceed as follows: Select the **Management** tab, click and hold an object from the right-hand device tree, then drag over to left-hand gray area. This will transfer the entire content of the object to a new library node.



Manually adding objects to libraries

Click here to enlarge: https://media-s3.paessler.com/prtg-screenshots/Setting-up-notifications-based-on-libraries_2.png

Step 2: Specify Notification Triggers

You can use library notifications very much the same way as notifications for sensors or devices.

- In your library, click the **Notifications** tab.
- Choose one of the various notification trigger types and configure it:
- **Add State Trigger** to send notifications about sensor states 163 over a specified time period.
- **Add Speed Trigger** to send notifications when having too little or too much traffic over a specified time period.
- **Add Volume Trigger** to send notifications when a predefined amount of data in the specified interval is accumulated.
- **Add Threshold Trigger** to send notifications if a sensor channel value goes beyond or below a certain limit.
- **Add Change Trigger** to send change messages sent by your sensor (only certain sensors provoke change triggers).

Example: Library Notification

You monitor hundreds of servers and want to keep an eye on CPU utilization. Using the channel limits within the sensors would cause an overwhelming amount of alerts, because CPUs can easily spike to 100% load for one scanning interval, without necessarily indicating a problem.

Using libraries, it only takes you a couple of minutes to create a notification setup that will notify you when a CPU runs at more than 90% load for more than 5 minutes.

We recommend the following steps:

1. Create a custom library.

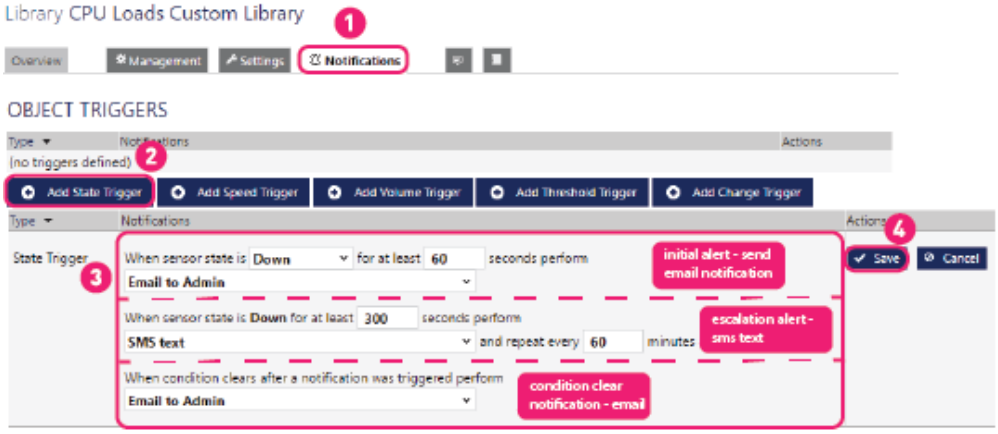
2. Add CPU sensors (via tag or type).

3. Add a threshold-based notification.

4. Enjoy complete piece of mind!

Add a state trigger to your library:

- Select **Notifications** tab (1).
- Click **Add State Trigger** (2).
- Enter the desired notification specifications in the definition box (3), including:
  - initial parameters (triggering state, triggering state duration, notification type triggered),
  - escalation parameters (triggering state is always the same, ongoing duration that triggers escalation, the type of the escalation notification triggered, and how often it is repeated),
  - if the trigger parameters no longer apply, enter the type of notification to be triggered.
- Click **Save** and you're done (4).



Example: setting notifications to libraries

Click here to enlarge: https://media-s3.paessler.com/prtg-screenshots/Setting-up-notifications-based-on-libraries.png

- An overview of all currently defined triggers appears.

On top of that, you may want PRTG to keep sending you **Tickets**, when a lower load threshold is periodically exceeded. This low priority notification will remind you to keep an eye on a certain part of your network. Proceed likewise via the **Add Threshold Trigger** button.

Note: You are completely free to set multiple triggers of the same type, so you can define increasingly serious notifications, as well progressing through different notification actions (like email and SMS text). For system-critical network components we recommend that you always define two different notification triggers (for example: email and escalation SMS text message).

The next steps will be to review the notifications settings, summarization, and notification actions in the main menu **Setup | Account Settings | Notifications**.

Step 3: Test, Troubleshooting, and Customization

To make sure the notification system works as desired, you can trigger test notifications out of PRTG.

- Click the **Test** button next to a notification under **Setup | Account Settings | Notifications**.
- Check if the test email and/or SMS text has arrived.

In test notification messages, placeholders will not be resolved.

Troubleshooting: if you suspect a notification might not arrive, proceed as follows:

- Choose **Setup | Account Settings | Notifications** from the main menu bar.
- Go to the notification action you have assigned in the library and click **Edit**.
- Review the notification setting so that:
  - The notifications are in the **Active** status.
  - The notifications have a schedule 2938 that does not conflict with the library you just set up or currently pauses the notification.
  - The summarization method collects alarms for a certain period. Also consider the **Timespan for Summarizing Messages** value.
  - The user email addresses (phone numbers) specified for each user account are correct.
- Check the **Notification Delivery Settings** 2961 under **Setup | System Administration | Notification Delivery**.

This only applies to PRTG on premises instances, not to PRTG on demand.

- Review the logs 198 for system events of the type "Notification" and the respective notification's name.
- Repeat these steps for all your notifications.

Sensors can perform simulated errors. Go to the library's **Overview** tab, right-click a sensor, and select **Simulate Error Status** from the context menu. You will see that the sensor status quickly changes and sends the following message: Simulated error (code: PE034). This also triggers the notification.

You can have the overall status of your library displayed as custom object on a map. See this Knowledge Base article: How can I use a status icon of a device in Maps which only considers specific sensors?

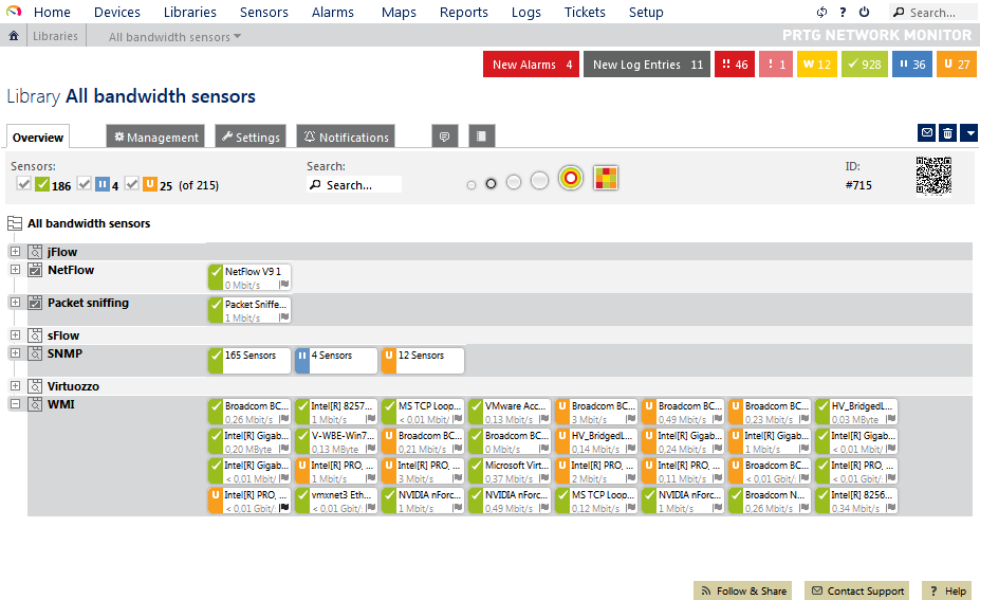
- https://kb.paessler.com/en/topic/59942

8.9 Libraries

With the **Libraries** feature in PRTG you can create special views of your device tree with up-to-the-minute monitoring status information, arranged the way you want it.



Example of a Library

In this section:

- Introduction 2845
- Start Libraries 2846
- Libraries List 2846
- Working with Libraries 2847

See also this video tutorial: PRTG Network Monitor – Libraries

Introduction

Libraries are a powerful feature that enables you to create additional views of your device tree. These views are updated with the same scanning interval as your device tree, showing the same monitoring data, but arranged the way you want. This is useful if you want to display data in different ways, like depending on target groups or a specific use case.

For example, you can create a library that contains an overview of all your bandwidth monitoring sensors, regardless of the device they are running on.

The library features include:

- Create libraries containing nodes with monitoring objects from all over your configuration.
- Show data from different PRTG probes in one library.

- Show different branches of your device tree right next to each other.
- Arrange sensors in a tree-like view regardless of the device they are running on.
- Filter your entire tree (or parts of it) for sensor type, state, or tag, showing only matching sensors.

You can create libraries easily, using drag&drop.

PRTG comes with several pre-configured standard libraries, which you can use right away. You can also change or delete them, if you like. The following libraries are automatically created when you install PRTG for the first time (visible for the PRTG Administrator user). Some of them will initially be empty, but as you add more sensors, they will be filled automatically according to the filter settings defined for the nodes of the libraries:

- All bandwidth sensors
- All CPU load sensors
- All disk space sensors
- All memory sensors
- All VMware sensors
- Sensors grouped by priority
- Sensors grouped by state

Sensors that are added to libraries are not counted against the maximum number of sensors of your license.

Start Libraries

Click **Libraries** in the main menu 235 to view or add custom views of your network's status and monitoring data. Hover over **Start Libraries** to show other menu items. Choose between:

LIBRARIES	
All	Open the Libraries overview list where you can view or add custom device tree views of your network status and monitoring data.
Add Library	Open an assistant to directly create 2848 a new library.
Select Library	Open an existing library. Hover over **Select Library** to show other menu items. Follow the menu path (it is specific to your setup) to select a library and open it.

Libraries List

In the **All** view, you see a list of all existing libraries. Using the links next to a library name, you can perform the following actions.

- **Edit**: Open this library and change the settings 2855 of the library and its nodes.
- **Clone**: Create a clone 2812 of this library.
- **Delete**: Delete this library.
- **Used by**: Show which other monitoring objects use this library.
- Click the **Add Library** button to add a new library.

Please also see **Working with Table Lists** 207. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2814 section.

Working with Libraries

For detailed information on how to create and edit libraries please see the following sections.

- **Libraries Step By Step** 2848
- **Management** 2852
- **Libraries and Node Settings** 2855
- **Context Menus** 2861

More

Video Tutorial: PRTG Network Monitor – Libraries

- https://www.paessler.com/support/videos/prtg-basics/libraries

8.9.1 Libraries Step By Step

In order to create a new library, follow the steps in this section. In the web interface, click on the **Libraries** entry in the main menu to show the libraries main screen.

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

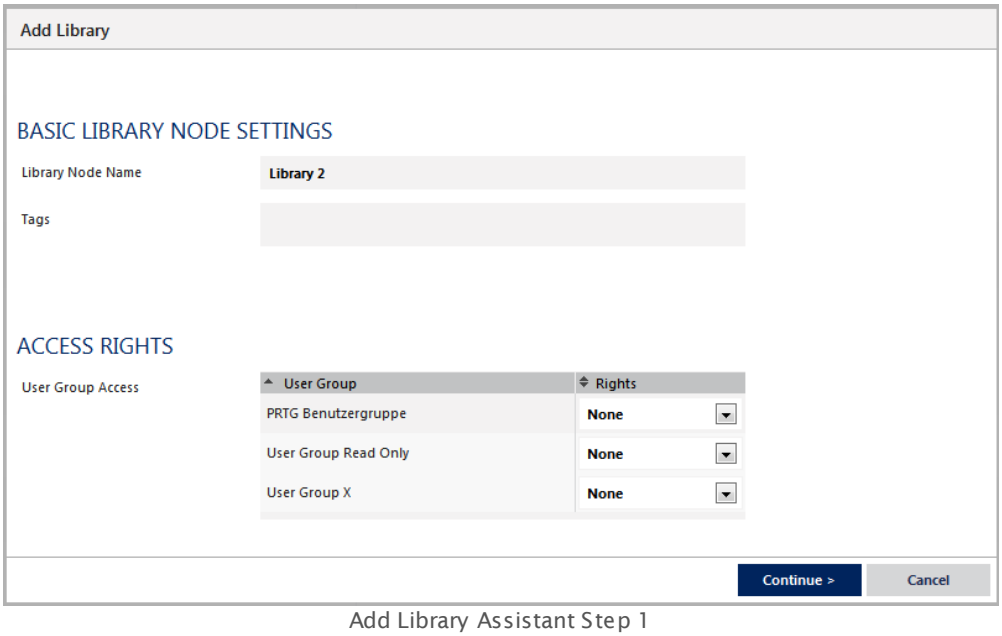
In this section:

- Step 1: Add Library 2848
- Step 2: Add Library Nodes 2849
- Step 3: Set Library Node Display Settings 2850
- Step 4: View 2850

Step 1: Add Library

- Click the **Add Library** button. An assistant is shown.
- Enter a **Library Name**.
- Define **Tags** and **Access Rights** if you like.
- Click **Continue**.

For detailed information, see **Libraries Settings** 2855 section.

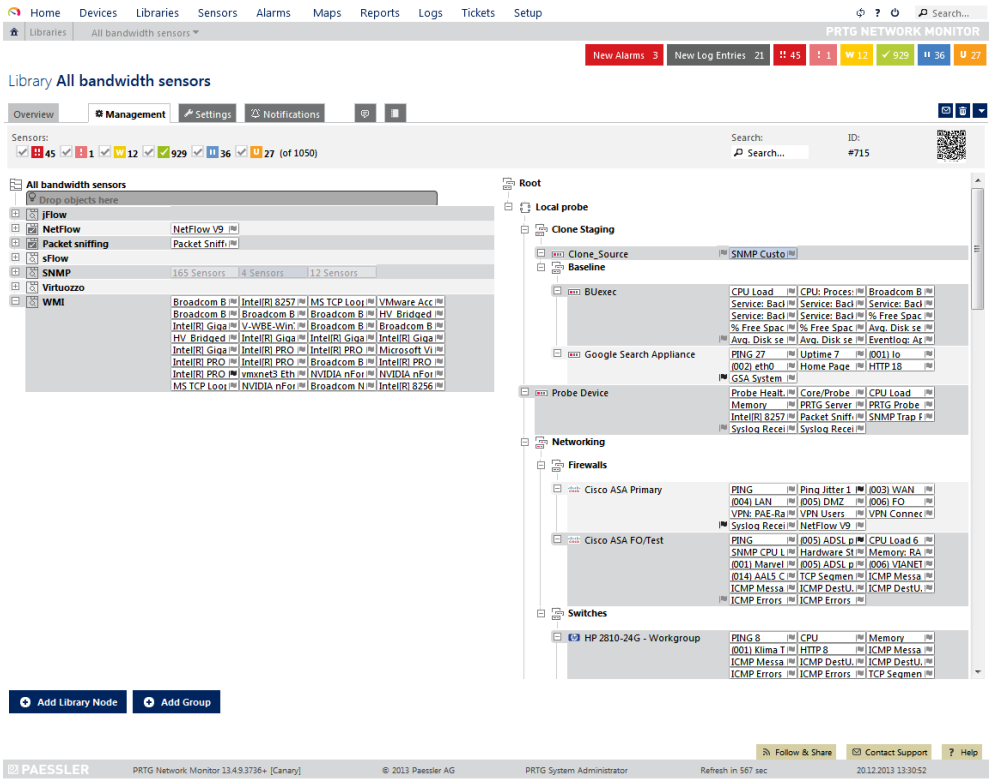


Add Library Assistant Step 1

Step 2: Add Library Nodes

Click the **Management** tab. You will see a split screen:

- On the left side, your library is shown (empty in the beginning).
- On the right side, you see a less colorful view of your device tree, as known from the device tree's Management [292] tab.



Bandwidth Library in Management Mode

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object will be added immediately as a new Library Node. Repeat this procedure as often as you wish until you have added all desired items to the library.

When adding single sensors to the library, there can only be one sensor in one library node.

Library nodes can contain up to 1,000 sensors.

You can also create nested library nodes by adding a new node underneath an existing one or to a group.

Drag and drop nodes within the library to change their position. If you want to change the monitoring object that is associated with a library node, you can change the **Linked Object** in the node's settings.

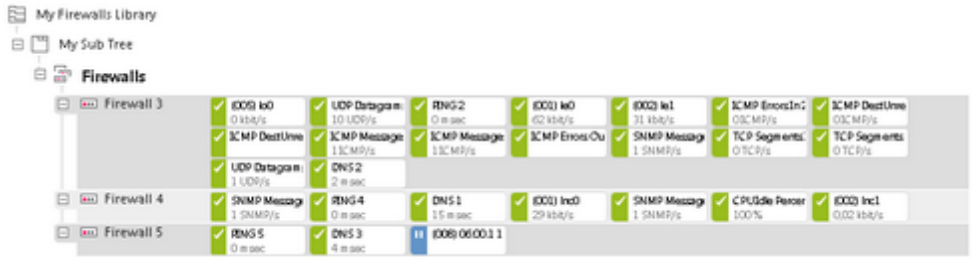
Step 3: Set Library Node Display Settings

You are still in the library **Management** tab.

Right-click the name of a Library Node and from the context menu, select **Edit | Settings...** to change the **Node Display Settings**. In this dialog, you can change the name of the library and its tags, as well as the linked object, node type, and filters.

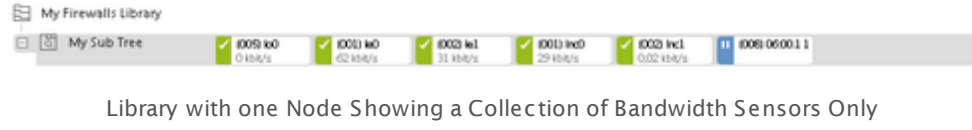
These settings are available for each library node. You can choose to either show the **Linked Object** as a sub-tree of your device tree, or to view a collection of all sensors underneath the **Linked Object**.

When selecting the sub-tree view, the library node will just look like a branch in your device tree, as shown in the screen shot below for the library node names "My Sub Tree".



Library with one Node Showing a Branch of the Device Tree

When selecting a sensor collection view, only the sensors underneath the **Linked Object** are shown, omitting probes, groups, and devices. You can additionally filter by certain sensor **Type**, **Status**, and **Tags**. Only matching sensors will be shown. The screenshot below shows the same **Linked Object** as above, but in sensor collection view, additionally filtered for sensors with a **bandwidthsensor** tag.



Library with one Node Showing a Collection of Bandwidth Sensors Only

For detailed information, see **Libraries and Node Settings** 2855 (Overview—Library Node Display Settings) section.

Step 4: View

Click the **Overview** tab to see the final appearance of your library. You have the following options:

- Hover over an object to view a popup window with recent monitoring and status data.

- Use the sensor status selection bar to select which sensors you want to see for the library: Simply remove check marks for sensor states you want to hide.
  This function is the same you know from the device tree's sensor status bar 155. The setting is reset the next time you open the library.

- Use the **Device Tree View** selection in the page header bar 155 to change the size of the library display.
  This function is the same you know from the device tree 157.

- Use the **Search** box in the page header bar 155 to search the library for a string in object names. Matching objects will be shown full-colored, all others will be grayed out while the filter is active. Click the small **x** symbol in the search field to reset the filter.
  This function is the same you know from the device tree 155.

It depends on the library's access rights and the currently logged in user account if it will be visible to other PRTG users. Also, clicking objects in the library (for example, sensors) will lead to more detailed information about the object or to an error message indicating insufficient access rights—depending on user account and access rights.

In libraries, you can right-click objects to access their **Context Menus** 2861. If you want you can also set up notifications to entire libraries, see our example chapter here 2840

More

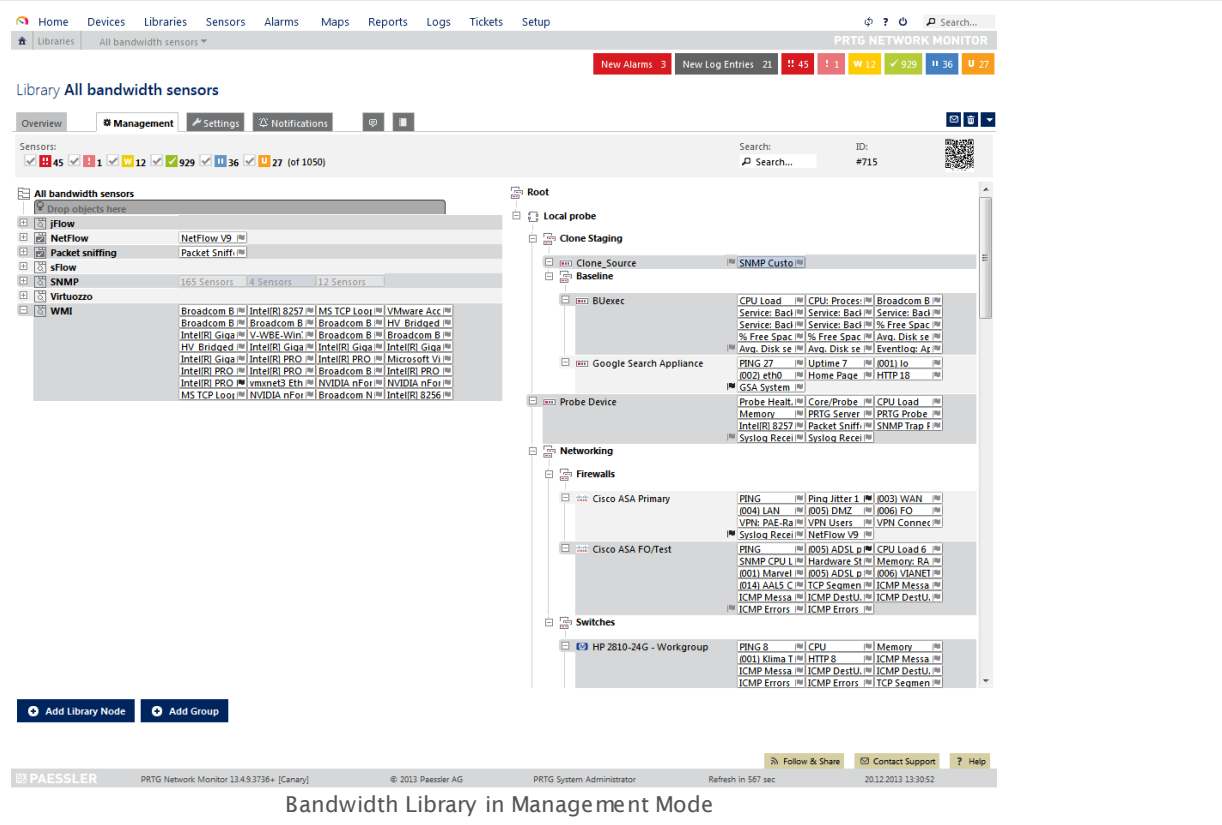
- https://www.paessler.com/support/videos/prtg-basics/libraries

8.9.2 Management

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Click the **Management** tab. You will see a split screen:

- On the left side, your library is shown (empty in the beginning).
- On the right side, you see a less colorful view of your device tree, as known from the device tree's **Management** 292 tab.



Bandwidth Library in Management Mode

Add and Change Library Nodes

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object will be added immediately as a new Library Node. Repeat this procedure as often as you wish until you have added all desired items to the library.

When adding single sensors to the library, there can only be one sensor in one library node.

Library nodes can contain up to 1,000 sensors.

You can also create nested library nodes by adding a new node underneath an existing one or to a group.

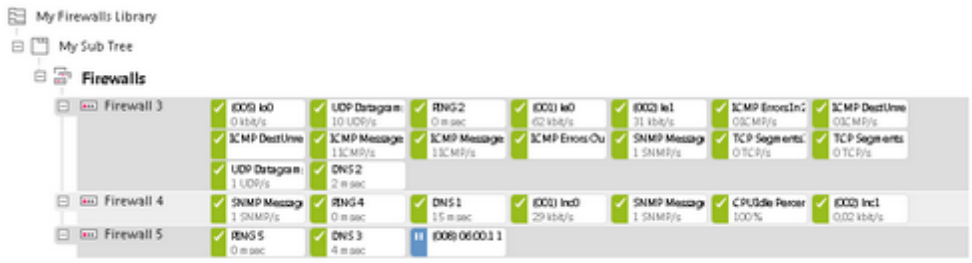
Drag and drop nodes within the library to change their position. If you want to change the monitoring object that is associated with a library node, you can change the **Linked Object** in the node's settings.

Set Library Node Display Settings

Right-click the name of a Library Node and from the context menu, select **Edit | Settings...** to change the **Node Display Settings**. In this dialog, you can change the name of the library and its tags, as well as the linked object, node type, and filters.

These settings are available for each library node. You can choose to either show the **Linked Object** as a sub-tree of your device tree, or to view a collection of all sensors underneath the **Linked Object**.

When selecting the sub-tree view, the library node will just look like a branch in your device tree, as shown in the screen shot below for the library node names "My Sub Tree".



Library with one Node Showing a Branch of the Device Tree

When selecting a sensor collection view, only the sensors underneath the **Linked Object** are shown, omitting probes, groups, and devices. You can additionally filter by certain sensor **Type**, **Status**, and **Tags**. Only matching sensors will be shown. The screenshot below shows the same **Linked Object** as above, but in sensor collection view, additionally filtered for sensors with a **bandwidthsensor** tag.

Library with one Node Showing a Collection of Bandwidth Sensors Only

For detailed information, see Libraries and Node Settings 2855 (Overview—Library Node Display Settings) section.

Context Menus

On right-click, there are different context menus available—in the **Management** as well as in the **Overview** tab.

For detailed information, please see **Context Menus** 2863 section.

8.9.3 Libraries and Node Settings

Using the libraries tabs you can access all functionalities and settings for a library.

Library Tabs

Overview

Click the **Overview** tab any time to show the current state of your library.

Library Node Display Settings

While in the **Overview** tab, click the name of a library node to change its settings. Or, while in the **Management** tab, right-click a library node's name and select **Edit | Settings...** from the context menu. In both cases, the following settings are shown.

You can only change the settings of a node if it already contains monitoring objects like groups, devices, or sensors.

BASIC LIBRARY NODE SETTINGS

Library Node Name	Enter a meaningful name for the library node.
Tags	Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the library. Tags are not case sensitive.

NODE DISPLAY SETTINGS

Linked Object	Click the reading-class symbol to change the object that is linked to this library node. The **Object Selector** 210 will appear.
Node Type	Select what you want to view for this library node. Choose between: ▪ **Show a subtree of the device tree in the library**: View all objects underneath the linked object as a device tree. ▪ **Show a collection of filtered sensors in the library (max. 1000)**: View all sensors underneath the linked object (only sensors are shown). You can combine several filters with each other (see below).

NODE DISPLAY SETTINGS

The node can show up to 1,000 sensors, surplus sensors are discarded.

Filter By Type

This option is only visible if collection of sensors is enabled above. Select if you want to filter the sensor list by a certain type. Choose between:

- **Show all sensor types**: Do not filter for a sensor type.
- **Show specific sensor types only**: Filter the sensor list of the linked object for certain sensor types.

This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

Select Sensor Types

This option is only visible if filtering by type is enabled above. A list of all sensor types is shown, currently available sensor types are shown in bold letters for your convenience.

Set a check mark in front of each sensor type you want to include in the library node view. You can also select and deselect all items by using the check box in the table head.

This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

You cannot filter for sensor types that are defined in PRTG Mini Probes.

Filter By Status

This option is only visible if collection of sensors is enabled above. Choose between:

- **Show all sensor states**: Do not filter for a sensor status.
- **Show sensors with a specific status only**: Filter the sensor list of the linked object for sensors in certain states.

Select Sensor States

This option is only visible if filtering by sensor state is enabled above. A list of sensor states is shown. Set a check mark in front of each status you want to include in the library node view. Choose from:

- **Unknown**
- **Up**
- **Warning**

NODE DISPLAY SETTINGS

- **Down**
- **Paused**
- **Unusual**
- **Down (Acknowledged)**
- **Down (Partial)**

You can also select and deselect all items by using the check box in the table head.

This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

Filter By Tags

This option is only visible if collection of sensors is enabled above. Choose between:

- **Show all sensor tags**: Do not filter for a tag.
- **Show objects with specific tags only**: Filter the sensor list of the linked object for sensors with a certain tag 124.

The tag of a sensor can also be inherited 122 by a parent object.

Select Tags

This option is only visible if collection of sensors is enabled above. Enter one or more tags 124 of sensors that you want to include in the library node view. You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, +snmp;-wmi (must have the tag snmp and must not have the tag wmi).

This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

Filter By Priority

This option is only visible if collection of sensors is enabled above. Choose between:

- **Show all priorities**: Do not filter for the priority setting 211 of a sensor.
- **Show objects with specific priority only**: Filter the sensor list of the linked object for sensors with specific priority.

The priority setting of a group, device, or sensor is ignored here; only the priority setting of the sensor itself is regarded.

NODE DISPLAY SETTINGS

Select Priority	This option is only visible if collection of sensors is enabled above. Define which priority setting sensors must have to appear in this collection. Set a check mark in front of each priority you want to include in the library node view. Choose from: ▪ ***** **(highest)** ▪ **** ▪ *** ▪ ** ▪ * **(lowest)** This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

After applying filters it might take several seconds for the changes to become visible. This is due to internal filter processes running in the background.

Management

Click the **Management** tab to edit the contents of your library, for example, to add items to the library using drag&drop.

For more details, see section **Management** 2852.

Settings

Click the **Settings** tab to open a library's general settings.

BASIC LIBRARY SETTINGS

Library Name	Enter a meaningful name for the library.
Tags	Enter one or more tags 124, separated by space or comma. For example, you can use tags later to search for the library. Tags entered here are inherited 122 to all library nodes underneath. Tags are not case sensitive.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2982 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 129.

When giving access rights to a user group, all members of this user group will be able to see the objects in the library just as seen by the user who originally created the library.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

You can define notification triggers for any kind of object libraries. This is even possible for dynamic libraries which can change with every scanning interval, for example, when you filter a library for the sensor status or priority.

For details about how to use notifications, please see section **Notifications** 2829.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Delete

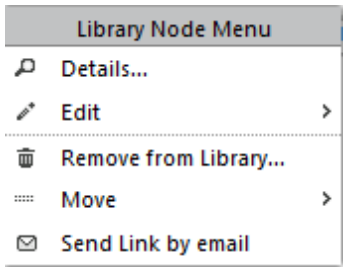
You can delete the entire library any time by clicking on the trash symbol on the right.

8.9.4 Context Menus

On right-click, there are different context menus available.

Library Node Menu

While in the **Overview** or the **Management** tab, right-click any library node to show its context menu.



Library Node Menu

- Select either **Details...** or **Edit | Settings...** to get to the Libraries and Node Settings 2855.
  While on the **Overview** tab, these settings are also accessible via left-click on the node's name.

- **Edit | Rename...** will give you an option to rename the library node quickly.
- **Remove from Library...** will remove this library node from the current library.
  This will not delete any objects in your device tree.

- The **Move | ...** options will move the library node up and down within the library.
- Click on the **Send Link by email** entry to open a new email using your system's standard email client. It will contain a direct link to the page you're currently viewing.

Monitoring Objects Menus

In libraries are the same Context Menus 215 available you already know from the device tree. With one exception: While accessing these menus within libraries, the **Move** and **Delete** options are disabled to avoid accidental changes to your device tree.

8.10 Reports

You can use reports to analyze historic monitoring results over a specified time such as one or more days, one month, or an entire year, and for your system configuration. You can create reports for all or only for certain sensors.

Introduction

PRTG includes a powerful reporting engine for the ad-hoc as well as scheduled report generation in HTML, PDF, CSV, and XML format. This means that you can run reports on demand or on a regular basis (for example, once a day or once a month). Furthermore, you can create reports for a single sensor or for a whole range of sensors. It is also possible to create HTML reports of your system configuration 2865.

The content and layout of the report is controlled by the report template of your choice and is the same for all sensors in a report. The report time that is shown in data tables and data graph legends depends on the system time of your PRTG core server, not on the timezone settings 2980 of the current user account.

Report Sample

The sample report above shows the report data for devices on a local probe. You can see graphs for the preceding week, plus data tables with numeric results.

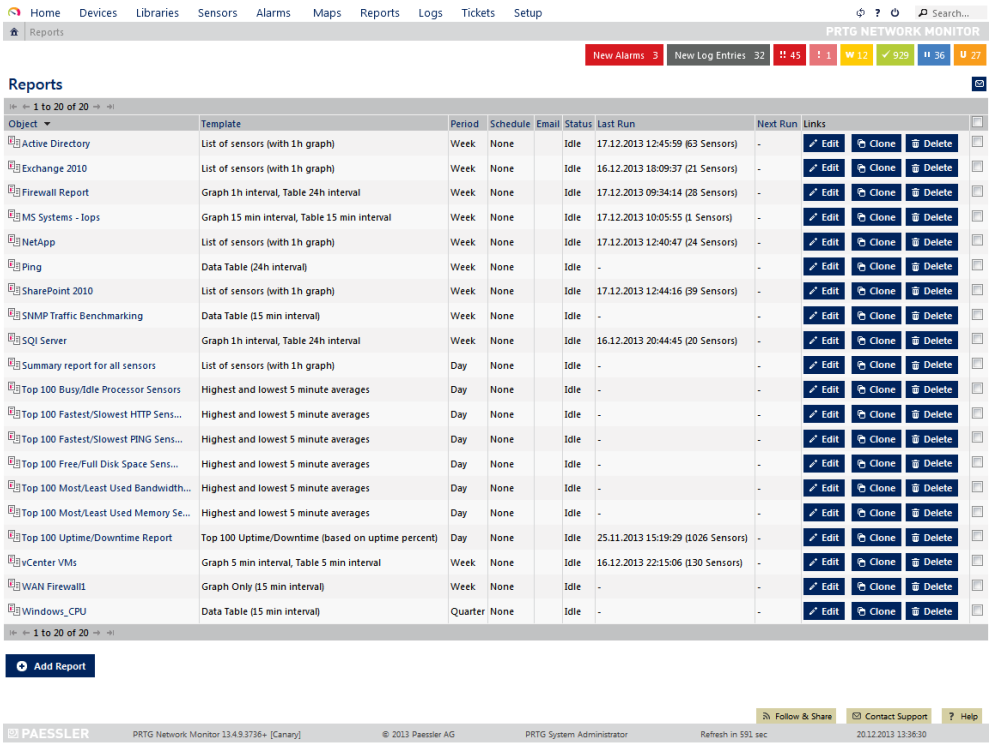
Start Reports

Click the **Reports** entry in the main menu 240 to view or add reports of your monitoring data. Hove over **Reports** to show other menu items. Choose between:

REPORTS

All	Open the Reports overview page where you can view or add reports of your monitoring data.
Add Report	Open an assistant to directly add 2866 a new report.
Select Report ›	Open an existing report. Point to **Select Report** to show other menu items. Follow the menu path (it is specific to your setup) to select a report.
Configuration Reports ›	Create reports for maps, reports, users & user groups, and system configuration to document changes to the configuration. Point to **Reports | Configuration Reports** to see the available configuration reports 2865.

Reports Overview



List of Reports

In the **All** view, you see a list of all existing reports for monitoring data. Every line shows information about one report:

- **Object**: Shows the name of the report.

- **Template**: Shows the name of the template that this report uses.
- **Security Context**: Shows the user account that PRTG uses to run the report.
- **Period**: Shows the time span that the report covers.
- **Schedule**: Shows if you set a schedule to regularly execute the report automatically.
- **Email**: If you set a schedule and an email address in the report settings, this shows the email address to which PRTG sends the report automatically.
- **Status**: Shows the current status of the report.
- **Next Run**: If you set a schedule in the report settings, this shows when PRTG runs the report the next time.
- **Last Run**: If you set a schedule in the report settings, this shows when PRTG ran the report the last time.
- **Number of Sensors in Last Run**: Shows about how many sensors the report includes data.

Using the buttons at the end of a row, you can **Edit**, **Clone**, and **Delete** a report.

Please also see **Working with Table Lists** 207. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2814 section.

Click the **Add Report** button to add a new report, or click the name of an existing report to view and edit its settings. You can also run a pre-configured report easily by clicking its name and then using the options in the **Run Now** tab.

For both options, please see the **Reports Step By Step** 2866 section.

You can only run configuration reports 2862 via the main menu.

Working With Reports

For detailed information on how to create, edit, and schedule reports, please see the following sections:

- **Reports Step By Step** 2866
- **View and Run Reports** 2870
- **Report Settings** 2873

Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when calculating data for large time spans. Data is then averaged regardless of the selected average interval.

TIME SPAN IN REPORT	MINIMUM LEVEL OF DETAIL (AVERAGE INTERVAL)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or larger

Reports for time spans of more than 500 days are not possible. If you enter a longer time span, it will automatically be shortened to 365 days.

Configuration Reports

Configuration reports are a special type of reports and show the current PRTG configuration. They are available for **Maps**, **Reports**, **Users & User Groups**, and **System Configuration**. PRTG generates configuration reports and displays them in a new browser window as an HTML page in the common PRTG report style (like, for example, Historic Data Reports 175 of sensors). You can use configuration reports, for example, to file and document changes to the configuration of your PRTG installation.

Configuration reports contain the same information as you can see on the overview pages of Maps 2885, Reports 2862, as well as on the system administration tabs User Accounts 2975 and User Groups 2982. The configuration report **System Configuration** includes the current system administration settings of the tabs User Interface 2943, Monitoring 2955, Notification Delivery 2961, Core & Probes 2967, and Cluster 2992.

Configuration reports are interactive so you can click available links to go to the corresponding webpage in the PRTG web interface.

8.10.1 Reports Step By Step

To create a new report or to run an existing one, follow the steps in this section. In the PRTG web interface, click on the **Reports** entry in the main menu to show the reports main screen.

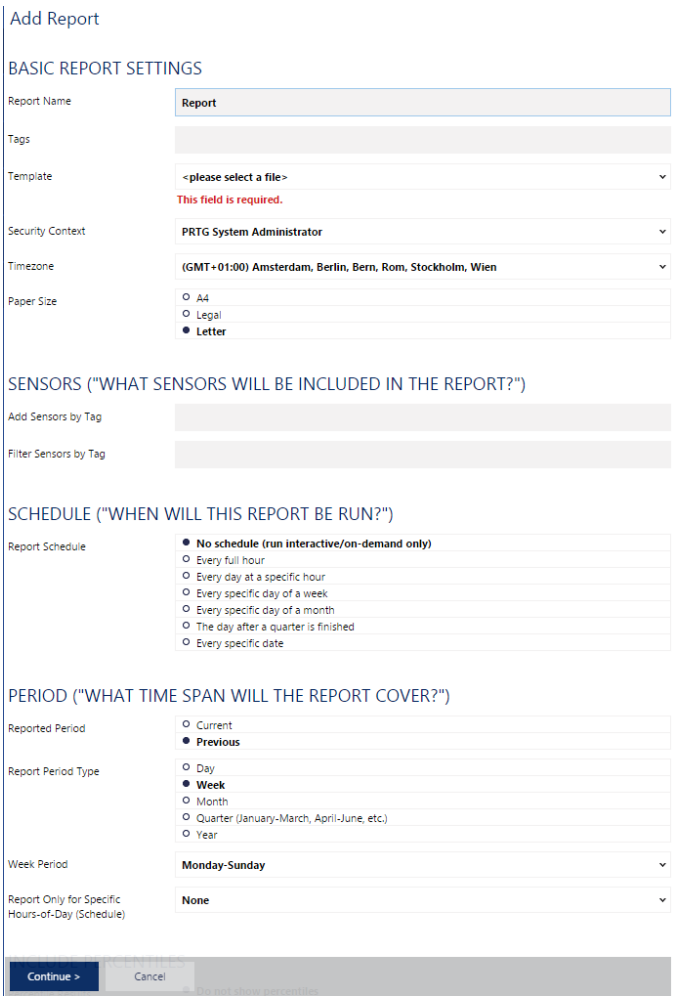
This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Quick Start: Run an Existing Report

PRTG is delivered with several pre-configured reports. To use one of them, click a report's name in the reports main screen and select the **Settings** tab. The next steps are the same as for completely new reports. Although some settings are already given, we recommend that you check them. For example, check the sensors that are included in the report. For some reports that come with PRTG, there are no sensors added yet. Continue with **Step 3: Define Additional Options** 2867 in this section.

Step 1: Add Report

Click the **Add Report** button to add a new report. An assistant appears where you can define various settings. First, enter a meaningful **Report Name**.



Add Report Assistant

Click here to enlarge: http://media.paessler.com/prtg-screenshots/add_report.png

Step 2: Select a Template

In the **Template** option, select one of the report templates from the list. This defines the overall look of your report and how detailed (regarding the intervals) monitoring data is included. For a detailed description of the available template options, please see the **Report Settings** 2873 section. If you are not sure yet, try a template that appears most suitable to you. You can still change all settings later.

Step 3: Define Additional Options

Select a **Security Context** (best choose **PRTG System Administrator**, if available), your **Timezone**, and the **Paper Size** for PDF generation.

For detailed information, see section **Report Settings** 2873.

Step 4: Select Nodes and Sensors

Choose the sensors you want to include in the report. When running a cluster 116, define the **Cluster Node** the monitoring data is taken from first. Select a specific node from the list. If you select **All nodes**, PRTG creates a report with data from all of your cluster nodes, but only the primary channel of every sensor appears in the report.

Every report shows monitoring results based on sensor data. There are two ways to include sensors in a report: You can either add sensors manually or by tag. In the **Add Sensors by Tag** field, enter one or more tags that match the sensor range you want a report for.

For example, enter the tag bandwidthsensor to include all sensors that measure bandwidth (or select it from the list of tags which PRTG suggests). PRTG provides this tag by default when you add any bandwidth sensor, so the tag typically gathers all bandwidth sensors, unless you configured your system differently. You can enter several tags. Hit the enter key, or insert comma or space after each tag and enter the next one. Use the **Filter Sensors by Tag** field to explicitly filter sensors with certain tags from the bulk of tags or manually selected sensors defined above.

Tagging is a great option to group sensors or other objects. For more information, see the **Tags** 124 section. You can also leave the tag fields empty and only choose specific sensors manually later.

Step 5: Decide on a Schedule and Additional Settings

In the **Report Schedule** section, choose if you want to run the report on a regular basis or on demand only. Also define which time **Period** will be covered by the report, if you want to show percentiles, if you want to generate CSV and XML data files for reports with data tables, and add report comments or special access rights.

For detailed information, please see the **Report Settings** 2873 section.

Scheduled reports are not executed on failover nodes 3212 by default.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Step 6: Check and Adjust the Sensors Included

After saving the settings, switch to the **Sensors Selected by Tag** tab to see a list of all sensors that you added with the tag(s) you defined in step 4. To change tags, go back to the **Settings** tab. You can additionally add sensors manually. To do so, switch to the **Select Sensors Manually** tab. The final report shows sensors from both manual and by tag selection.

See section **Report Settings** 2882 for detailed information.

Step 7: Run Report

Switch to the **Run Now** tab, select a period, and in the **Processing Options** select **View Report as HTML**. Click the **Run Report** button. PRTG generates the report in a new browser window or tab immediately. Depending on the number of selected sensors and the used template, it may take a few minutes until you see the report. If you do not want to wait, close the newly opened browser window or tab and select a PDF option in the **Processing Options**. Click the **Run Report** button again. The report is then generated in the background and you get a **ToDo ticket** or email once it is finished.

For large PDF reports, PRTG automatically splits the output into separate files to avoid huge PDF files. You can change the number of sensors that PRTG includes into each PDF file by editing the report templates manually. For details, see this Knowledge Base article: Can I change the number of PDFs created by a report?

More

Knowledge Base: Can I change the number of PDFs created by a report?

- https://kb.paessler.com/en/topic/11863

8.10.2 View and Run Reports

In the web interface, click the **Reports** entry in the main menu to show the reports main screen. Click a report's name to select it. Using the reports tabs you can access all functionalities and settings for this report. Click the **Go to all reports** button at the bottom of the page to return to the list of **Reports**.

Report Tabs

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Run Now

On the **Run Now** tab you can execute a report immediately with the settings configured.

RUN REPORT "[Name]"

Report for	Define the time span covered by the report. Choose between: ▪ **Current Period**: Use monitoring data of the current period. The actual time span depends on the report period type defined in the report's settings. It can be today, this week, this month, or this year. ▪ **Previous Period**: Use monitoring data of the last period. The actual time span depends on the report period type defined in the report's settings. It can be yesterday, last week, last month, or last year. ▪ **Select a Period**: Use monitoring data of a period other than current or previous. Select below. ▪ **Select Date Range Manually**: Define a custom time span for the monitoring data that will be used. Set start and end date below.
Date Range	This selection is only visible if you enable the period option above. From the list, select a data range for which PRTG will generate the report. The shown time spans depend on the available monitoring data and on the report period type defined in the report's settings. It can be days, weeks, months, or years.
Start Date	This selection is only visible if you enable the date range option above. Define the begin of the time span for which PRTG will generate the report. Use the date time picker to enter the date and time. Make sure you define a valid period.

RUN REPORT "[Name]"

End Date	This selection is only visible if you enable the date range option above. Define the end of the time span for which PRTG will generate the report. Use the date time picker to enter the date and time. Make sure you define a valid period.
Quick Range	This selection is only visible if you enable the date range option above. Choose between different pre-defined ranges by simply clicking the desired range. Each click changes the **Start** and **End Date** fields above accordingly.

PROCESSING OPTIONS

File Format and Delivery

Define how you want to view the report. Choose between:

- **View Report as HTML**: Directly view the report in your web browser. PRTG loads it in a new browser window or tab.
- **Create and store PDF and data files (available for templates with data tables)**: Create a PDF file and, depending on the **Data Files** settings 2873 of the report, CSV and XML files of the report and store them. Once finished, you will find it in the **Stored Reports** tab and a ToDo ticket 201 will be created. By default, PRTG sends out a notification email to the administrator in this case.
- **Create PDF and data files (available for templates with data tables), store them, and send by email**: Create a PDF file and CSV and XML files of the report, store the files, and send them via email once finished.

CSV and XML data files are only generated for report templates that include data tables.

To create PDF files, ensure the print spooler service is running on the system with your PRTG server.

Certain special characters, for example, 4-byte unicode characters, may not be displayed correctly in PDF reports. As workaround, generate an HTML report and save it as PDF.

For large PDF reports, PRTG automatically splits the output into separate files to avoid huge PDF files. You can change the number of sensors that PRTG includes into each PDF file by editing the report templates manually. For details, see this Knowledge Base article: Can I change the number of PDFs created by a report?

PROCESSING OPTIONS

Target Email Address	This setting is only available if you define above to send the report by email. Enter a valid email address to which PRTG will send the report. You can change the configuration for outgoing emails in the System Administration—Notification Delivery 2961 settings.
Compression	This setting is only available if you define above to send the report by email. Define if you want to compress the attached report files before sending. Choose between: ▪ **Send files uncompressed**: PRTG will not compress the report files before they are sent by email but send the files in their original size. ▪ **Send all in one ZIP file**: PRTG will compress the report files to a ZIP file before they are sent by email.

Click the **Run Report** button to start report generation. Depending on the number of selected sensors, this may take a while. If you experience a long waiting time when generating HTML reports for immediate view, please consider using one of the PDF options. You can then view the report as soon as it has finished.

Any sensor graph in your report will only show the channels that are enabled via the **Show in Graphs** option in the Sensor Graph Settings 2782 of the corresponding sensor.

Reports cannot show uptime or downtime data for the Sensor Factory Sensor 1438.

Stored Reports

In the **Stored Reports** tab you can view all PDF reports and data files created in the past. Click a name to open the report. Reports are stored until they are deleted according to the data purging settings of your PRTG configuration. You can set data purging limits for reports in the System Administration—Core & Probes 2972 settings.

Other Tabs

For all other tabs, please see the Report Settings 2873 section.

8.10.3 Report Settings

In the web interface, click the **Reports** entry in the main menu to show the reports main screen. Click a report's name to select it. Using the reports tabs you can access all functionalities and settings for this report. Click the **Go to all reports** button at the bottom of the page to return to the list of **Reports**.

Report Tabs

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Run Now

On the **Run Now** tab you can execute a report immediately with the settings that you configured before.

See section View and Run Reports 2870 for details.

Stored Reports

On the **Stored Reports** tab you can view reports created in the past.

See section View and Run Reports 2872 for details.

Settings

Click the **Settings** tab to open the settings of a report.

BASIC REPORT SETTINGS

Report Name	Enter a meaningful name to identify this report. The name of the report is used in reports lists 240 and as headline of generated reports.
Tags	Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the report. Tags are not case sensitive.

BASIC REPORT SETTINGS

Template

Select a template for the report. The template defines the overall look of your report and in which detail (interval) the report shows monitoring data. PRTG includes several report templates out of the box. You can choose from templates in the following categories:

- **Data Table Only**: Create a report with data tables only. Choose from several intervals. Reports with this template also generate data files (CSV and XML) if set in the **Data Files** section of the report.
- **Graph Only**: Create a report with graphs only. Choose from several intervals. Reports with this template cannot generate data files (neither CSV nor XML).
- **Graph with Data Table**: Create a report with graphs and data table. Choose from several intervals. Reports with this template also generate data files (CSV and XML) if set in the **Data Files** section of the report.
- **List of Sensors**: Create a report in a compact sensor list style. This is available with and without graphs. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 10 Uptime/Downtime**: Create a report with up to 10 objects with the highest uptime and downtime each. You can choose between data in percent and hours. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 100 Highest and Lowest**: Create a report with up to 100 objects with the highest and lowest average values. Choose from different intervals. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 100 Uptime/Downtime**: Create a report with up to 100 objects with the highest uptime and downtime each. You can choose between data in percent and hours. Reports with this template cannot generate data files (neither CSV nor XML)

Monitoring data within an interval is averaged. See also the comment on data averaging in the **Reports** 2864 (Automatic Averaging) section.

For information on how to modify templates, see this Knowledge Base article: How do I modify PRTG's report templates?

Security Context

Define the user account 2975 that you want to use for access to your monitoring data. The report only contains objects which the selected user 129 is allowed to view.

Choose a PRTG user from the list. The available users depend on your configuration. By default, this is the user that created the report. PRTG System Administrator users can change this setting.

BASIC REPORT SETTINGS

Timezone	Define the time zone to use for all date-specific settings in this report (see below 2878). Choose a time zone from the list.
Paper Size	Define the paper size in which PDF reports are created. Choose between: ▪ **None**: Do not specify a paper format. The size is set automatically. ▪ **A4**: Use German DIN A4 format. ▪ **A3**: Use DIN A3 format. ▪ **A2**: Use DIN A2 format. ▪ **Legal**: Use North American legal paper format. ▪ **Letter**: Use North American letter paper format. ▪ **Ledger**: Use North American ledger paper format.
Orientation	Define the page orientation for the data in PDF reports. Choose between: ▪ **Portrait**: Use portrait mode for the page orientation. ▪ **Landscape**: Use landscape mode for the page orientation. The landscape format is designed to properly show data tables of sensors with many channels. Other parts of the report will remain in portrait mode and do not re-size to the landscape format.

SENSORS ("WHAT SENSORS WILL BE INCLUDED IN THE REPORT?")

Cluster Node	This field is only visible when you run PRTG in **Clustering** 116 mode. Define the cluster node from which the report will take monitoring data. Choose a cluster node from the list. The available options are specific to your configuration. By default, the current master node is set. Select **All nodes** to create a report with data from all of your cluster nodes. A report for all nodes includes data of the primary sensor channels only, not for other sensor channels. Be careful with big reports for all nodes because the report generation may slow down significantly.

SENSORS ("WHAT SENSORS WILL BE INCLUDED IN THE REPORT?")

If you select a failover node, report and data files will not show data from the local probe or from a remote probe and might be empty or show "0" values.

You can generate CSV and XML data files only for a single failover node. If you choose the option **All nodes**, the report will not create data files!

Add Sensors Manually

If you want to manually choose the sensors included in this report, please save settings and switch to the **Select Sensors Manually** 2882 tab.

Add Sensors by Tag

Define the sensors included in this report by tag 124. Enter one or more tags. The report covers all sensors that have at least one of the tags. Please enter a string or leave the field empty.

You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, +snmp;-wmi (must have the tag snmp and must not have the tag wmi). See the section **Tags** 124 for details.

Tags are inherited 124 automatically. So, for example, if you enter the tag of a group 119 here, the report will include all sensors within this group. For detailed information, see the **Inheritance of Settings** 122 section. For sensors you add by tag, the report includes all sensor channels automatically, except if you run a PRTG cluster 116 and select **All nodes** in the **Cluster Node** selection above.

Filter Sensors by Tag

Filter the included sensors further. This option works best in combination with manually added groups and devices. From the sensors that are implicitly added because of their parent objects, the report includes only the ones with the tags you enter here.

Enter one or more tags to include sensors in the report. Confirm a tag with enter, space, or comma key. Please enter a string or leave the field empty.

You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, +snmp;-wmi (must have the tag snmp and must not have the tag wmi). See the section **Tags** 124 for details.

SCHEDULE

Report Schedule	Define at which time you want to run the report. Choose between: ▪ **No schedule (run interactive/on-demand only)**: Only use the options on the **Run Now** tab to start generating this report manually. ▪ **Every full hour**: Run this report every 60 minutes. ▪ **Every day at a specific hour**: Run this report every 24 hours. ▪ **Every specific day of a week**: Run this report every 7 days. Specify the day below. ▪ **Every specific day of a month**: Run this report on a specific day every month. Specify below. ▪ **The day after a quarter is finished (i.e. at 1. April for the 1. January - 31. March Quarter)**: Run this report for every quarter of the year. ▪ **Every specific date**: Run this report on a specific date every year. Specify below.
Specify Hour	This setting is only visible if you select a specific hour above. From the list, select the hour you want to run the report at. PRTG automatically chooses a suitable time within this hour, usually at the beginning of it.
Specify Day	This setting is only visible if you select the day of week or day of month option above. From the list, select a day of week or a date of the month you want to run the report. If you select **Last**, the report will always run on the last day of the month, regardless of how many days the month has. If you select a date that does not exist in every month, for example, February 31st , PRTG will automatically run the report on the last day of this month.
Specify Date	This setting is only visible if you select the specific date option above. Enter a valid date in the format **DD.MM.**, for example, 31.12. The report runs annually on this date.
Scheduled Processing	This setting is only visible if you select one of the schedule options above. Define what to do with a finished report. Choose between: ▪ **Save report to disk and send it by email**: Create a PDF file and, depending on the **Data Files** setting, data files of the report, store it, and send it via email. You find the report in your emails and on the **Stored Reports** tab. Define an email address below.

SCHEDULE

- **Save report to disk only**: Create a PDF file and, depending on the **Data Files** 2881 setting, data files of the report and store it. Once finished, you find them on the **Stored Reports** tab. You receive also a ToDo ticket 201 from PRTG. By default, PRTG sends out a notification email to the administrator in this case.
- **Send report by email only**: Create a PDF file and, depending on the **Data Files** 2881 setting, data files of the report and send them via email once finished. With this option the report is not permanently stored in PRTG. Define an email address below.

For large PDF reports, PRTG automatically splits the output into separate files to avoid huge PDF files. You can change the number of sensors that PRTG includes into each PDF file by editing the report templates manually. For details, see this Knowledge Base article: Can I change the number of PDFs created by a report?

Certain special characters, for example, 4-byte unicode characters, may not be displayed correctly in PDF reports. As workaround, generate an HTML report and save it as PDF.

Email Address

This setting is only visible if you select a send by email option above. Enter a valid email address to which PRTG sends the report. To enter more addresses, separate them by comma. PRTG sends a message with all recipients in the "To" field of the email.

You can change the configuration for outgoing emails in the **System Administration—Notification Delivery** 2961 settings.

Send to User Group

This setting is only visible if you select a send by email option above. From the list, choose a user group to send an email with the report to all members of this group. You can edit user groups in **System Administration—User Groups** 2982.

If you define individual email addresses (see field above) and a user group, PRTG will send the report to the individual email addresses as well as to the members of the selected user group. In both cases, PRTG will send one message with all recipients in the "To" field of the email.

Compression

This setting is only visible if you select a send by email option above. Define if PRTG will compress the attached report files before sending them out. Choose between:

- **Send files uncompressed (default)**: PRTG sends the report files by email in their original size.
- **Send all in one ZIP file**: PRTG will compress the report files to a ZIP file before they are sent by email.

PERIOD

Reported Period	Define the time span the report covers. Choose between: ▪ **Current**: Use monitoring data of the current period. Define the period type below. ▪ **Previous**: Use monitoring data of the last period. Define the period type below.
Report Period Type	Define the type of period you want to create a report for. Choose between: ▪ **Day** ▪ **Week** ▪ **Month** ▪ **Quarter (January-March, April-June, etc.)** ▪ **Year** Depending on your selection, different period selections are shown below.
Day Period	This setting is only visible if you select day period type above. Define the hours when a day starts and ends. Choose from the list of hours. Default setting is **0:00-23:59**.
Week Period	This setting is only visible if you select week period type above. Define when the week starts and ends. Choose between: ▪ **Monday-Sunday**: A reported week starts on Monday. ▪ **Saturday-Friday**: A reported week starts on Saturday. ▪ **Sunday-Saturday**: A reported week starts on Sunday.
Month Period	This setting is only visible if you select month period type above. Define when the month starts and ends. Choose between: ▪ **1.-last day**: A reported month starts on the first and ends on last of the month. ▪ **15.-14.**: A reported month starts on 15th and ends on 14th of the month.
Year Period	This setting is only visible if you select year period type above. Define when the year starts and ends. Choose between: ▪ **1/1-12/31**: A reported year starts on January 1st. ▪ **7/1-6/30**: A reported year starts on July 1st.

PERIOD

Report only for specific hours-of-day (Schedule)	Include certain time spans within the defined period only. If a schedule is selected, the report will include only monitoring data for specified hours or weekdays within the defined period. Select **None** to include all available monitoring data in the report, or choose a schedule. For example, select the schedule **Weekdays** to exclude all weekends from the report. The available schedules depend on your configuration. For more information, please see the **Account Settings—Schedules** 2938 section.

INCLUDE PERCENTILES

Percentile Results	Define if you want to include an additional percentile calculation 3194 of your data in the report. Choose between: ▪ **Do not show percentiles:** PRTG does not use a percentile formula to calculate your monitoring results. It will show only the standard values. ▪ **Show percentiles**: PRTG adds a column to the result data tables, which shows percentiles for every sensor channel. Percentiles are not available for all report templates. If a template does not support percentiles, they will simply not show up in the report, even when you enable this setting. Likewise, percentiles are not available in a cluster setup if you choose the option **All Nodes** in the **Cluster Node** setting in the sensor section above.
Percentile Type	This setting is only visible if you select **Show percentiles** above. Enter the percentile type you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter "95" here and 5 % of peak values will be discarded. Please enter an integer value.
Percentile Average Interval	This setting is only visible if you select **Show percentiles** above. Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is 300 seconds (5 minutes). This means that PRTG takes 5 minute averages as basic values for the percentile calculation. Please enter an integer value.

INCLUDE PERCENTILES

Percentile Mode

This setting is only visible if you select **Show percentiles** above. Choose the mode for percentile calculation:

- **Discrete**: PRTG takes discrete values to calculate percentile results.
- **Continuous**: PRTG interpolates between discrete values and bases the calculation on interpolated values.

DATA FILES

CSV / XML Files

Define if you want to generate CSV and XML files for data tables in the report in addition to the PDF. Choose between:

- **Do not include data files**: PRTG will not generate CSV or XML files for the report but only a PDF file.
- **Include CSV files only (available for templates with data tables)**: PRTG will generate and store CSV files in addition to the PDF. CSV data files are only generated if the report uses a template with data tables.
- **Include XML files only (available for templates with data tables)**: PRTG will generate and store XML files in addition to the PDF. XML data files are only generated if the report uses a template with data tables.
- **Include all data files (available for templates with data tables)**: PRTG will generate and store CSV and XML files in addition to the PDF. CSV and XML data files are only generated if the report uses a template with data tables.

If you run PRTG in a cluster, the report will not generate data files if you select **All nodes** in the sensors selection 2875 above. Please specify a single failover node to get data files.

REPORT COMMENTS

Introduction

Enter a custom text that will show up on the first page of the report. Please enter a string or leave the field empty.

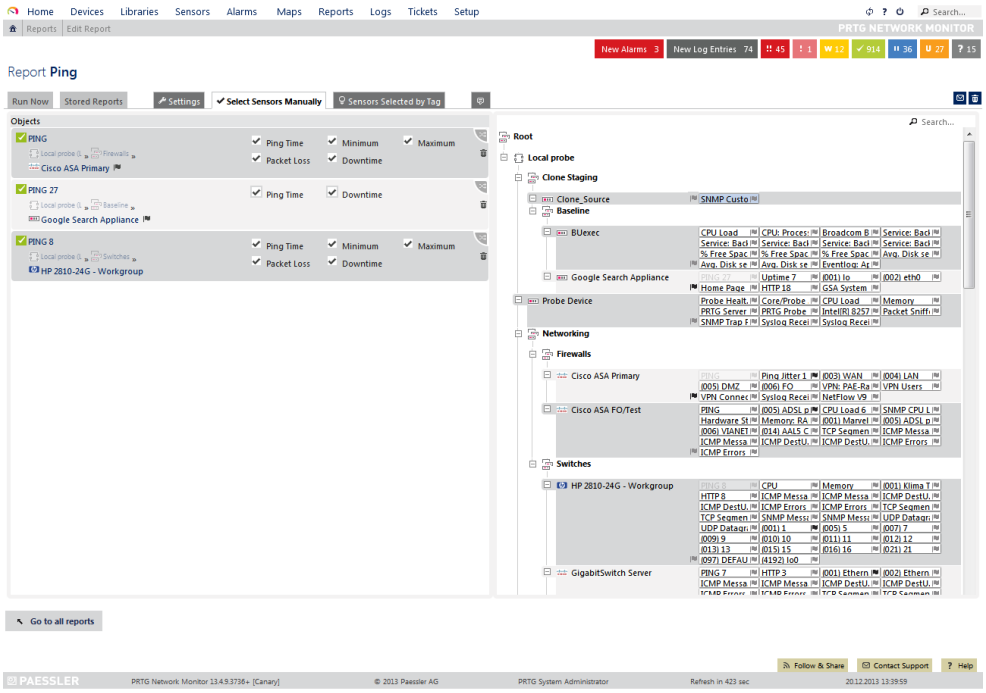
REPORT COMMENTS	
Footer Comments	Enter a custom text that will show up at the end of the report. Please enter a string or leave the field empty.

ACCESS RIGHTS	
User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists. ▪ **Read**: Users in this group can see the object and review its settings. ▪ **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights. You can create new user groups in the **System Administration—User Groups** 2982 settings.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Select Sensors Manually

Click the **Select Sensors Manually** tab to manually choose sensors that you want to include in the report. You see a split screen: On the left side, there is a list of objects that the report already contains (empty in the beginning), and on the right side, you see a less colorful view of your device tree, like on the Management 292 tab in the device tree. You can add objects to the report using drag and drop.



Manual Selection for Reports

- **Add Items**
  From the device tree on the right side, drag objects and drop them on the list on the left side. This can be entire probes, groups, devices, or single sensors. Each dropped object is added immediately as a new list item. Repeat this procedure as often as you wish until you have added all desired items to the report.
  The objects you drop on the left side are always added to the end of the list, you cannot add objects directly in another order.

- **Select Sensor Channels**
  If you add a sensor to the selection, you can specify the sensor channels that the report will include. By default, all channels are selected. To exclude a channel from the report, remove the check mark in front of a channel name.
  If you run a PRTG cluster 116, you can only choose between single channels if you select one specific **Cluster Node** in the report settings. If you select **All nodes** the report's **Cluster Node** setting, the channel selection is not available and the report contains only the primary channel of each sensor.

- **Change Order**
  You can change the order of manually selected objects on the left side with drag and drop. Each item you add appears at the end of the list by default. To change the order, point to the drag and drop symbol (two arrows) in the upper right corner of a selected item, drag it to the desired position, and drop it there.

- **Remove**
  To remove any objects from the report, click the trash can symbol next the respective list item, or select several list items while holding down the Ctrl key and click the green trash symbol appearing at the top of the list.

Your selection is saved automatically, and there is no undo function.

The final report will include both sensors selected manually and those selected by tag.

Sensors Selected by Tag

Click the **Sensors Selected by Tag** tab to view all sensors that are added to the report depending on the **Add Sensors by Tag** setting of the report. In the table list 207, you see all sensors that you added to the report by their respective tags. This is for your information only, you cannot change sensors here.

However, you can switch to the **Settings** tab of the report and change the tags that the report uses to include sensors. Additionally, you can also exclude sensors with certain tags there. The final report will include both sensors selected manually and those selected by tag.

For sensors that you add by tag, all sensor channels are included in the report automatically, except you use a PRTG cluster 116 and select **All nodes** in the **Cluster Node** selection of the report. In this case, the report includes only the primary channel of each sensor.

The final report will include both sensors selected manually and those selected by tag.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.11 Maps

With the **Maps** feature (some people might call this 'dashboards') you can create web pages with up-to-the-minute monitoring status information in a customizable layout. Using this unique concept, you can also make your overview pages of live data publicly available, if you like.

Example of a PRTG Map

In this section:

- Introduction 2885
- Start Maps 2886
- Maps Overview 2887
- Maps Rotation 2887
- Working with Maps 2889

Introduction

There are countless possibilities for the implementation of maps. For example, you can use this feature to:

- Create network maps with status icons for each device on the map.
- Create quick views of your network that can be shown on network operations center screens.

- Create a quick network overview for publishing on the Intranet, allowing at-a-glance information for management of other employees.
- Create a custom view of the most important sensors in your monitoring setup.
- Create Top 10 lists of the sensors of a specific group or device.

Technically, a map is a usual HTML web page. You can build a schema of your network by choosing from hundreds of device icons and connect them with lines. A map can consist of the following elements:

- A set of map items, which can include device icons, sensor status icons, graphs, data tables, lists of sensors, connection lines, geographical maps, or custom HTML code.
- An optional background image (a JPG, PNG, or GIF file, for example, your company logo, or a graphical view of your network).

You can also specify the size of the map. Using the AJAX-based map editor, you can place the items anywhere on the map, and you can also change their size. Each map has a unique URL which you can use to link to the map. Users who want to access the map either need an account in your PRTG installation, or can access a public URL of the map if you allow the **Public Access** feature. Public maps contain a unique **Map ID** access key in the URL to block unwanted visitors.

PRTG comes with several pre-configured standard maps that you can use right away. You can also change or delete them, if you like. The following maps are automatically created when you install PRTG for the first time (visible for the PRTG System Administrator 129 user):

- **Sample Dashboard**: By default, this map shows a graphical structure of your device tree, the sunburst view 157 of your device tree, a list of alarms 190, a geo map 2824, and more. This sample map has a 5***** priority 211 so you can also open it under **Home** in the main menu 231. To not show it in the main menu, define a lower priority.
- **Magic Map**: By default, this map shows the sunburst view 157 of your device tree with several graphics that demonstrate customization capabilities of the maps feature.

Start Maps

Click the **Maps** entry from the main menu 240 to view or add custom views of your network's status and monitoring data. Hover over **Maps** to show other menu items. Choose between:

MAPS	
All	Open the Maps overview page where you can view or add custom views of your network's status and monitoring data.
Add Map	Open an assistant to directly add 2890 a new map.
Select Map ›	Open an existing map. Hover over **Select Map** to show other menu items. Follow the menu path (it is specific to your setup) to select a map.

Maps Overview

In the **All** view, you see a list of all existing maps. Using the links next to a map name, you can do the following:

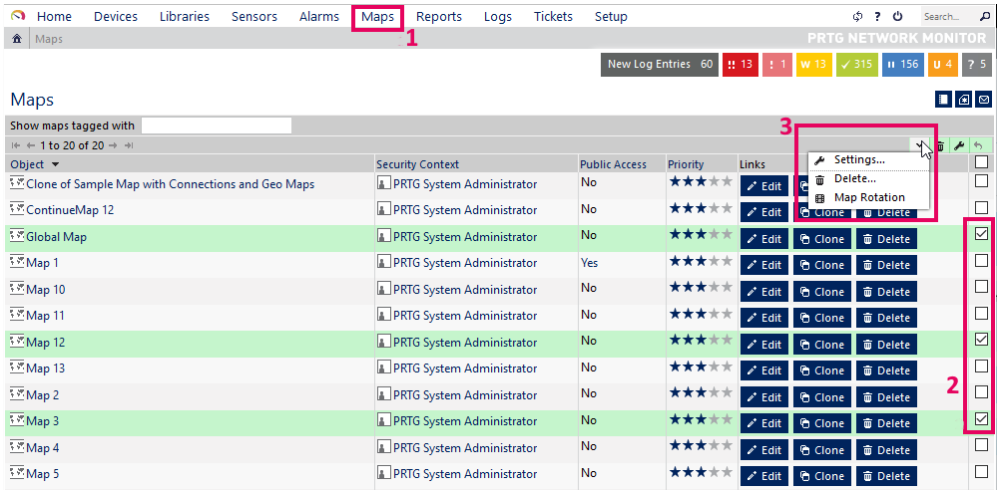
- Click the name of a map to view it.
- Click the **Edit** button to adjust the settings of this map.
- Click the **Clone** button to create an exact copy of this map. As soon as you click this, the map is cloned and the cloned map's settings are shown.
- Click the **Delete** button to remove this map.
- Click the **Add Map** button to add a new map.
- Define the priority 211 of a map. Maps with a 5***** priority appear in the main menu bar 231 under **Home** for direct selection (up to 10 entries).

Please also see **Working with Table Lists** 207. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2814 section.

Map Rotation

The Map Rotation feature in PRTG allows you to show several maps or dashboards rotating on one page. Map rotation makes it possible to show different information on one screen based on time. You can compare this with a slide show. Follow the steps below to configure your own map rotation.

1. Open the **Maps** overview page from the PRTG main menu bar 231.
2. Select the maps that you want to rotate using the checkboxes.
3. The **Multi-Edit** 2814 menu appears.
4. Click **Map Rotation** in the multi-edit menu.
5. That's all: PRTG will show the selected maps in rotation on a new page.
   This requires login credentials for PRTG.
6. You can change the time until a new map appears with the arrows symbol in the lower right corner. Hover over the arrows symbol and choose between **10s**, **30s**, **60s** (seconds), **10m** (minutes), and **Refresh** now.



Start Map Rotation

Public Map Rotation

You can also set up a **public map rotation** that you can use without login credentials. For this purpose, you have to create a custom URL that defines which maps will publicly rotate. The public map rotation URL has this format: the address of your PRTG server, followed by **/public/mapshow.htm?ids=**, followed by map IDs and secret keys.

1. **Allow public access** in the settings 2904 of the maps you want to rotate.
2. Find the map IDs and secret keys to add them to the URL that opens the public map rotation.
   a. To find the ID of a map, open the map with your web browser. The map ID is included in the URL of the map as value of the parameter **id**, for example, https://<yourprtgserver>/map.htm?id=**2124**, where the number **2124** is the needed ID.
   b. To find the secret key of a map, open the settings of the map, make sure you have selected a public access option 2904, and copy the entry of the **Secret Key** field.
3. Connect each map ID with the secret key of the same map using a colon, in this format: **mapid:secretkey**
4. Add all IDs with their secret keys to the URL for the public map rotation. Separate each mapid:secretkey token from the next mapid:secretkey token with a comma.
5. The complete URL has this format: **https://yourprtgserver/public/mapshow.htm?ids=mapid1:secretkey1,mapid2:secretkey2,mapid3:secretkey3**
   This is an example URL for public rotation of two maps:
   https://prtg.example.com/public/mapshow.htm?ids=9507:4049BEA1-B89C-4B5D-ACC4-3C8E00566EB8,9358:718D3CE1-DF00-4B92-AE8A-E0253B912C37
6. Open the created URL with your browser and PRTG will start the public map rotation.
7. You can change the time until a new map appears with the arrows symbol in the lower right corner. Hover over the arrows symbol and choose between **10s**, **30s**, **60s** (seconds), **10m** (minutes), and **Refresh** now.

Working with Maps

For detailed information on how to create and edit maps, and to learn how to make them accessible to others, please see the following sections.

- Maps Step By Step 2890
- Map Designer 2893
- Maps Other Settings 2902

8.11.1 Maps Step By Step

To create a new map, follow the steps in this section. In the web interface, click **Maps** in the main menu bar 231 to show the maps main screen.

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

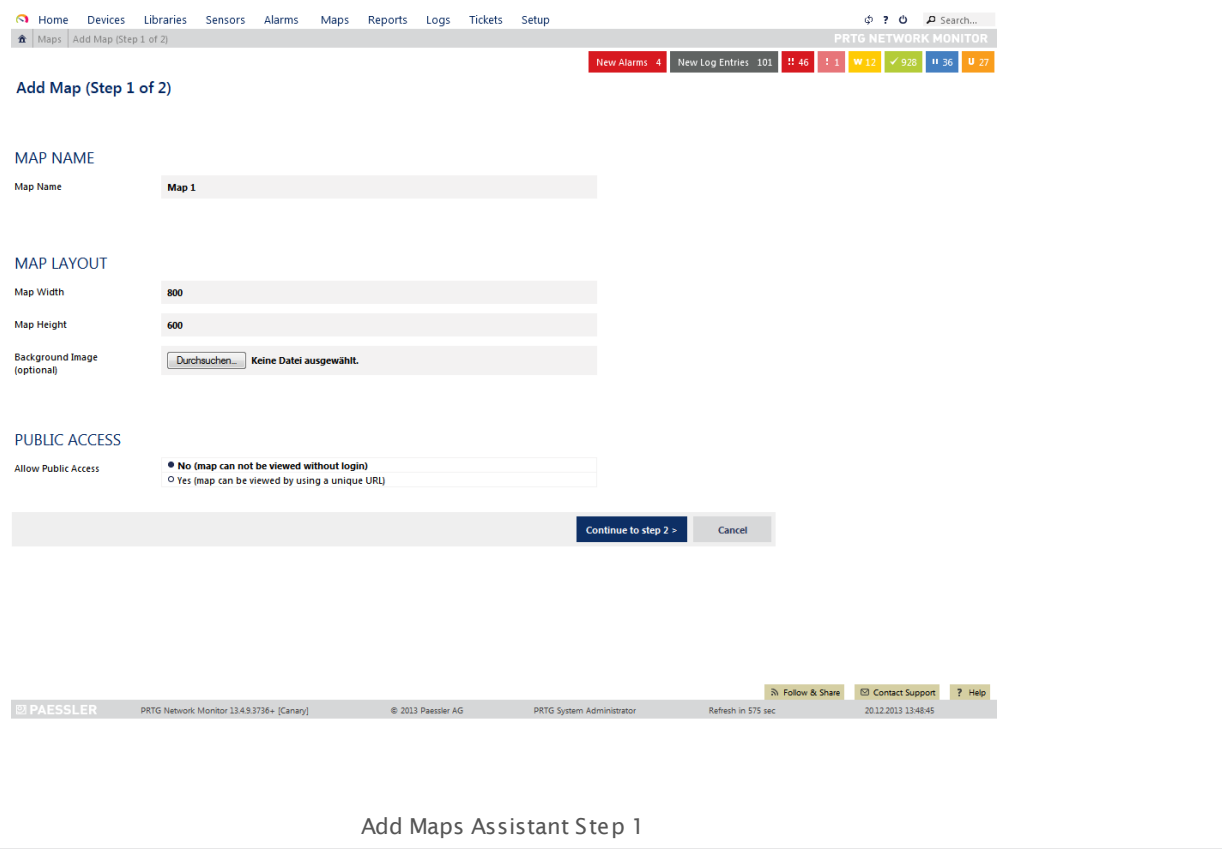
In this section:

- Step 1: Add Map 2890
- Step 2: Add Map Items 2891
- Step 3: View and Share 2891

Step 1: Add Map

Click the **Add Map** button. An assistant appears. Enter a **Map Name** and define **Map Layout** settings (size and optionally a background image). in the **Public Access** section, define the accessibility to your map without login.

For detailed information, see **Maps Settings** 2902 section (Settings).



Add Maps Assistant Step 1

Step 2: Add Map Items

- Click the **Continue to step 2** button to open the **Map Designer**.
- Select an object from the device tree on the left.
- Drag&drop an object from the items list on the right to the main window of the Map Designer.
- The item will immediately appear on the map.
- Define further properties of the item: mark it in the main window of the Map Designer and see section **Properties** on the right. **Save** your changes to the properties.
- Repeat this procedure as often as you wish until you have added all desired items to the map.
- Drag items to change their position. You can also draw connection lines between items and edit the properties of existing items.

For detailed information, see **Map Designer** 2893 section.

Step 3: View and Share

Click the **View Map** tab to see your map. Later, PRTG will show it the way you see it there. If available for an object, you can click most object names as well as all sensors. It depends on the access rights of the object and the currently logged in user account if you can get more detailed information about the object or an error message indicating insufficient access rights.

Click the **Get HTML** tab to get the direct URL of your map that you can share with others.

For detailed information, see **Maps Settings** 2905 section.

The single map items will refresh in the refresh interval you define for this map when viewing it. Hover over the arrows symbol in the lower right corner to define the interval.

Create Advanced Maps

PRTG Maps provide the possibility to publish data from various sources. Besides using the default map items you can create a completely individual map with desired data in any design. See the following articles for more details.

- **Adding External Information to PRTG Maps:** https://kb.paessler.com/en/topic/9263
  Embed information from other sources than PRTG into your map using IFRAME or IMG, for example, weather and traffic maps or webcam images.
- **Map Rotation and Public Map Rotation:** **PRTG Manual: Maps** 2887
  Show several maps rotating on one page just like in a slide show.
- **Nest Maps:** https://kb.paessler.com/en/topic/71833
  Display and link multiple maps within on map.

- **Accumulating Sensor Data with HTTP XML/REST Value Sensor:** https://kb.paessler.com/en/topic/71932
  Display sensor data from various PRTG installations in a single map using the **HTTP XML/REST Value sensor** 976.
- **Use your Own Images in PRTG Maps:** https://kb.paessler.com/en/topic/8043
  Add any browser-compatible image to your map.
- **Adding and Customizing Map Objects:** https://kb.paessler.com/en/topic/1703
  Create customized or completely new map objects.
- **Custom Map Objects for PRTG Maps:** https://kb.paessler.com/en/topic/61263
  Find read-to-use custom map objects and other map customizations.

Video Tutorial: How to Create Maps in PRTG

- https://www.paessler.com/support/videos/prtg-advanced/creating-maps

8.11.2 Map Designer

Use the **Map Designer** to create a map web page representing your network.

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

In this section:

- Use a Proper Browser 2893
- Basic Design Concept 2893
- Device Tree Selection 2894
- Properties Selection 2895
- Edit Existing Map Items—Properties Box 2898
- Edit Existing Map Items—Hover Icons 2898
- Edit Existing Map Items—Using Cursor Keys 2899
- Draw Connection Lines Between Items 2899
- Snap To Grid 2900
- Undo and Redo 2900
- More 2901

Use the Proper Browser

Due to the map designer's extensive scripting capability, it is important that you use a compatible browser when editing maps. We recommend that you use Google Chrome 57 or later (recommended). You can also use Mozilla Firefox 52 or later or Microsoft Internet Explorer 11. The map designer is not fully compatible with earlier versions of Internet Explorer or Opera browsers.

Basic Design Concept

Click the **Map Designer** tab to open the editor. It might take a few moments to load. Here, you can create your map by adding or changing items. The designer screen consists of three main parts: The **Device Tree** on the left side, the current **Map** in the middle, and the **Properties** on the right side.

If you get unresponsive script warnings, please see this Knowledge Base article: Why does my browser show an unresponsive script warning while loading the Map Designer?

Map Designer

Each map item takes attributes from both selections.

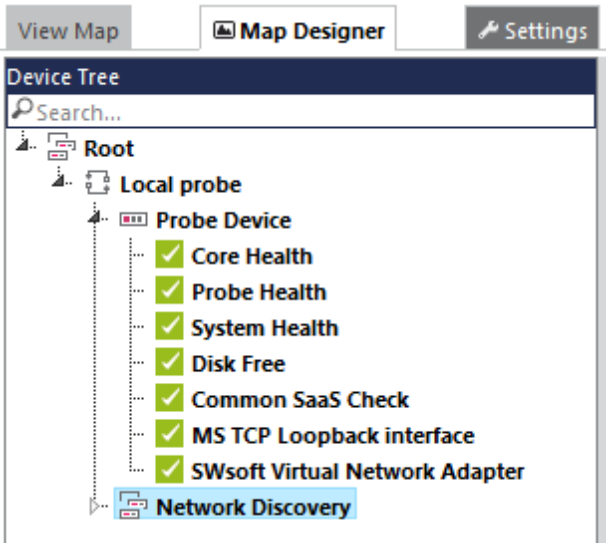
- **Device Tree** (left): Select the monitored object whose data you want to show on the map.
- **Properties** (right): Define how to show the map item.

Simply drag&drop any object from either side onto the map, or double-click on an object. You will always see all changes immediately.

Device Tree Selection

Use the **Device Tree** to select the monitored object whose data you want to show on the map (this can be a probe, a group, a device, or a single sensor). To find the desired object you have the following options:

- Use the arrow symbols at the beginning of each line to open nodes in the device tree and show objects below probes, groups, and devices.
- Enter a few characters into the **Search** box in the upper left corner to search for names (or part of names) of objects in your configuration. You will see the search results immediately. Click the red **x** icon to clear your search.



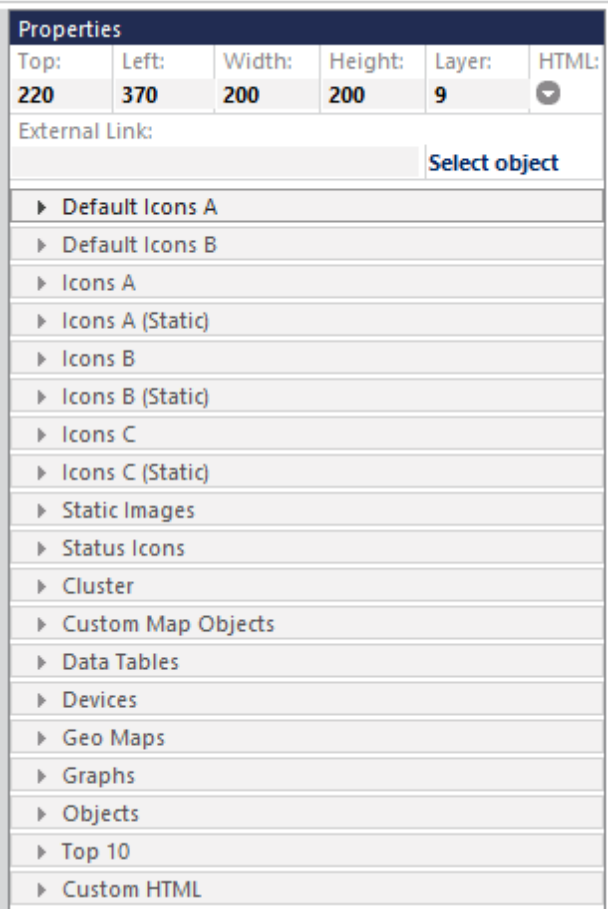
Device Tree Selection in the Map Designer

- No matter which method you choose to find the desired object, you can always drag any object from the **Device Tree** onto a free area of the map to create a new map item.
- If you drag it onto an existing map item, it replaces the existing item while **Properties** and size stay the same.
- You can also select a map item and double click a **Device Tree** object to replace the map item. If no item is selected, double clicking an object adds a new map item.
- To gain more space for map editing, reduce the size of the **Device Tree** box by dragging its right border to the left. Drag it to the right to enlarge it again.

Properties Selection

Use the **Properties** selection to define how to show the map item (for example, as an icon, a map, a table, or a graph). Select the appearance in different categories. Hover over a property object to get a live preview of it (in most cases).

If a certain **Properties** object is not available for the selected **Device Tree** object, you will see a corresponding text note.



Properties Selection in the Map Designer

There are many different property object types available. Simply click one of the categories to show all available types.

- **Default Icons A, Default Icons B**
  These categories offer a variety of iconic symbols of typical network devices in the current PRTG style. Category A comes with object data which category B does not include.
- **Icons A, Icons B, Icons C**
  These three categories offer a variety of iconic symbols of typical network devices. Below each icon you can see the object name and a sensor overview for the object. This shows how many sensors are in which status 163. For some sensors, a mini graph is shown as well.
- **Icons A (Static), Icons B (Static), Icons C (Static)**
  These three categories offer the same variety of iconic symbols of typical network devices as the category described above. Here, no object data is displayed but only the icon.
- **Static Images**
  This category offers free or public domain geographical maps from different sources. Use properties section Geo Maps if you want to show PRTG **Geo Maps** 2824 in the map.

The items in this section are independent from the selected **Device Tree** objects.

For additional geographical maps and other map customizations, please see this Knowledge Base article: Where can I find custom map objects and other map customizations?

- **Status Icons**
  This category offers options to insert status 163 icons in different styles. These show the object name and an overview of how many sensors there are and their status. For example, you can add "traffic lights" or the QR code of a monitoring object to your map. There is also an object available for audible alert that will play a sound when the number of alarms of the monitored object are > 0. Note that your browser must support playing embedded sounds for this icon.

See also this Knowledge Base article: Which audible notifications are available in PRTG? Can I change the default sound?

- **Cluster**
  If you use the PRTG **Clustering** 116 feature, you can add icons to your map which show the status of your cluster.
  The **Map** icon does not scale automatically, so the nodes are displayed on top of each other by default. Please manually enlarge this icon in the main window of the **Map Designer** (downwards and to the right) until it fits your needs.
- **Data Tables**
  Choose from several table lists 207 that show sensor lists for the currently selected object. You can also choose from several lists that show sensors in a certain status only.
- **Devices**
  Add several views of your device tree 157 to the map, including sensor gauges 166 for the select object.
- **Geo Maps**
  In this category you can choose between a globe and a geographical map. You can see the location of the currently selected object in the **Device Tree** on the map. To use this feature, you must enable Geo Maps integration and you have to enter a **Location** in the settings of the monitoring object you want to use this with. For more information, please see the **Geo Maps** 2824 section.
  If Geo Maps integration is disabled, you will only see white boxes instead of map previews.

- **Graphs**
  This category offers different graph styles in several dimensions and detail. You can also select graphs including a legend or sensor states.
- **Objects**
  Add some simple geometric shapes to your map. The items in this section do not depend on the selected object in the **Device Tree**.
- **Top 10**
  Choose from several tables that show the top 10 sensors in certain categories, like least used CPUs, highest bandwidth usage, best availability, or slowest websites.
- **Custom HTML**
  You can use this property, for example, to add external images or applets to your map. To actually add custom HTML code to your map, add the item, and mark it to edit 2898. You can then copy your custom code into the **HTML Before** and **HTML After** fields in the **Properties** box on the right side.

No matter which object you choose, you can always drag any object from the **Properties** box onto a free area of the map to create a new map item. If you drag it onto an existing map item, it replaces this item, while its **Device Tree** object attributes and size stay the same. You can also select a map item and double click an object in the **Properties** box to replace the map item. If no item is selected, double clicking an object will add a new map item.

To gain more space for map editing, reduce the size of the **Properties** box by dragging its left border to the right. Drag it to the left to enlarge it again.

Edit Existing Map Items—Properties Box

Click a map item to select it. You can then edit its attributes using the fields in the upper part of the **Properties** box on the right side:

- **Top**, **Left**, **Width**, and **Height** fields
  Enter position and size values for direct positioning. Click the **Save** button to save your settings. Alternative: Use the mouse to move and resize a map item.

- **Layer** field
  The layer number defines if an item appears on top of or behind another item if they overlap. The item with the higher number appears on top. Enter a positive integer value and click the **Save** button to save your settings. Alternative: Use the arrow symbols in the context menu of a map item to **Bring to front** or **Send to back** an item one layer (see below).

- **External Link**
  PRTG maps are interactive. You can enter the address of any website here. If you click the map item when viewing the map, PRTG will open this page in a browser window. Enter the whole URL to an external website (for example, https://www.paessler.com) or the address of a subpage of your PRTG installation (for example, devices.htm).

- **HTML**
  Click the arrow symbol underneath to show the **HTML Before** and **HTML After** fields. Any HTML code you enter in these fields is added before or respectively after the map item. Enter your custom HTML code that embeds an object and click the **Save** button. Your HTML object is inserted into the map. For example, you can enter the code <img src="http://media.paessler.com/common/img/logoclaim_r1.gif"> to insert an image of a Paessler logo.

Edit Existing Map Items—Hover Icons

Hover over a map item to show the edit icons for it.

- **Bring to front (arrow up symbol)**
  Move this item one layer to the front. This is useful when adding several items to a map that overlap each other.

- **Send to back (arrow down symbol)**
  Move this item one layer to the back. This is useful when adding several items to a map that overlap each other.

- **Delete (trash symbol)**
  Delete this item.
  Be careful! The item will be deleted immediately without notice and you cannot undo this. Alternative: Select the item and press the Del button on your keyboard.

- **Drop Connections (scissors symbol)**
  If there are connection lines between two items, you can delete all lines starting from this item. Connection lines will be dropped immediately.

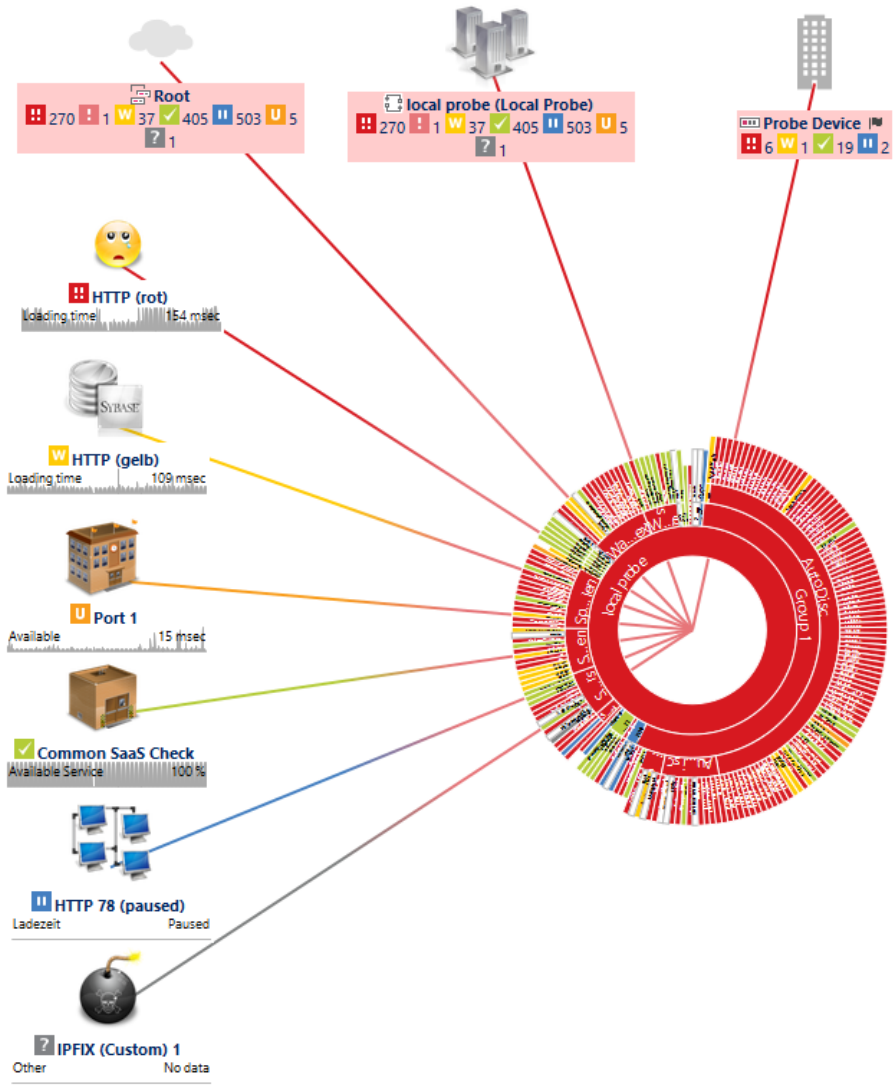
Edit Existing Map Items—Using Cursor Keys

While an object is selected, use the cursor keys to move it one pixel at a time. Hold the Shift key in combination with the cursor keys to move the object 10 pixels at a time.

Draw Connection Lines Between Items

You can draw connection lines between any map items via drag and drop. Click the gray handles next to an item and drag a line to the item you want to draw a connection to. A line between these items appears immediately. This can be useful to indicate network connections or logical coherence between two items. To delete connection lines, click the scissors symbol in the item's edit icons 2898.

Lines between objects are colored dynamically depending on the status 163 of linked objects. For example, a line is red as long as one of the object's icons shows a red **Down** status. This only affects half of the line, at the end where the red sensor is shown. If both objects connected show a red sensor, this results in a continuous red line.



Map with Status Colored Connection Lines

Snap to Grid

Choose **Snap to Grid** below the **Device Tree** box to define how map items are positioned when adding or moving them via drag and drop. The setting is active immediately. With snap to grid enabled, you can place items aligned with the grid only. If you deselect the **Snap to Grid** option, you can place map objects completely free.

Undo and Redo

You can revert previous changes to the map and its objects with the **Undo** button (Ctrl+Z) in the **Device Tree** box. To revert undo actions, use the **Redo** button (Ctrl+Y). You can undo and redo up to 50 changes when you work on a map. Because PRTG saves changes persistently in your configuration, you can even revert changes later.

Both buttons are only available if they can apply, otherwise they are grayed out.

8.11.3 Maps Settings

Using the Map tabs you can access all functionalities and settings for a map.

Map Tabs

View Map

Click the **View Map** tab any time to show a preview of your map.

Map Designer

Click the **Map Designer** tab to edit the contents of your map.

For details, see manual section Map Designer 2893.

Settings

Click the **Settings** tab to open a map's general settings.

When using the **Add Map** dialog, not all of these settings are available. You can change them later by clicking the **Settings** tab.

BASIC MAP SETTINGS

Map Name	Enter a meaningful name for the map.
Security Context	Define the user account that the map will use for access to monitoring data. The map will only contain objects that the selected user 129 is allowed to view. Please choose a user account from the list. The available users depend on your configuration. By default, this is the user that created the map. PRTG Administrator users can change this setting.
Timezone	Define the time zone that the map will use for all date-specific options. Select a time zone from the list.
Tag Filter	This setting affects table map objects. Enter one or more tags separated by spaces or commas to include sensors in tables. Only sensors with one of the tags entered here will appear in this map's data tables, including sensors that inherit 122 tags from parent objects. Please enter a string or leave the field empty.

BASIC MAP SETTINGS

For some map objects like sunburst and treemap, the tag filter applies to devices, groups, and probes. If you use only tags of sensors, these map objects will not appear on the map. Filtering sunburst and treemap objects with multiple tags may not work properly and is not officially supported.

Use this setting with care because it will affect all tables of the current map!

MAP LAYOUT

Map Width	Define the width of the map in pixels. Please enter an integer value.
Map Height	Define the height of the map in pixels. Please enter an integer value.
Automatic Scaling	Define if you want the map to automatically adapt to your screen size. Choose between: ▪ **Scale map view to fit browser size**: The size of the map adapts automatically to the size of your screen. Choose this method if the map is shown on various screens with different resolutions so that it uses the available place in the browser window the best possible way. ▪ **Do not auto-scale map view**: The map uses always the size that you define above.
Background Picture	Define if you want to use a background picture for the map. Choose between: ▪ **Use an image in the background of the map**: Use a custom background image that you define below. ▪ **Do not use a background image**: Do not use a background image.
Background Image	This option is only visible if you enable a background picture above. Click the **Choose File** button and select an image from your computer or network. Only images in the format JPG, PNG, and GIF are supported. The file size must be smaller than 20 MB. If you try to upload other images, you get an error message.

MAP LAYOUT

Background Color	Select a background color for this map. Either enter a hex color code or choose a color from the color selector. The hex color code field will always display the currently defined color.

PUBLIC ACCESS

Public Access	Define if others can see the map. Choose between: ▪ **No public access (map cannot be viewed without login)**: Do not allow public access to the map. Only users with both a login to the PRTG web interface and sufficient access rights can see the map. ▪ **Allow public access (map can be viewed by using a unique URL)**: Allow access to the map using a unique address. The URL contains a key that you can change below. The map will be an interactive public map. ▪ **Allow public access, disable all links (map can be viewed by using a unique URL)**: Allow access to the map using a unique address. The URL contains a key that you can change below. If you choose this option, all links on the map are disabled, so it will be a non-interactive public map.
Secret Key	This field is only visible if public access is enabled above. The key is automatically generated. It is part of the public URL for the map. You can also enter a customized string. We recommend that you use the default value. For more information on public access, please see the Get HTML 2905 section. The characters comma "," and colon ":" are not allowed in the secret key field!

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists.

ACCESS RIGHTS

- **Read**: Users in this group can see the object and review its settings.
- **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.
- **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights.

You can create new user groups in the **System Administration—User Groups** 2982 settings.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Get HTML

Your PRTG map is like a standalone HTML page. You can make it accessible to others, if you like. Depending on the **Public Access** setting 2902 of your map, a visitor needs to provide PRTG user account login data to view the map, or sees the map immediately using a URL containing a secret key. When using this unique key, you can also include your map on another webpage, embedding it via <iframe>.

- **Option 1: Link to a web page with the map that requires login credentials**
  The shown URL requires login credentials in order to display the map. PRTG asks the user trying to view the map via this URL for login credentials.
  In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize the URL you use for access to your needs.
- **Option 2: Link to a web page that displays the map without a login**
  To get the shown URL working for public access without a login, enable **Public Access** in the settings tab 2902 of your map.
  In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize the URL you use for access to your needs.
- **Option 3: Show a map inside other web pages using an IFRAME**
  For your convenience, this shows source code for adding an iframe to another webpage. It includes a URL for direct access. Just copy the code and paste it into your webpage code. Also enable **Public Access** in the settings tab 2902.
  In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize the URL you use for access to your needs.

While a map is shown via these URLs, you can change the refresh interval any time by hovering over the arrows symbol in the lower right corner. Choose between **10**, **30**, or **60** seconds, **10** minutes or **Refresh** now. The map adapts automatically to the size of the browser window if you enable the auto-scaling setting 2902.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Delete

You can delete the entire map any time by clicking the trash symbol on the right.

8.12 Setup

In the setup settings of the PRTG web interface, you can define almost all system settings for PRTG. However, some of the machine-oriented settings are defined using two Windows administration tools (see Others 2908 section below).

In the main menu, click on **Setup** to show the available options.

- Some setup options are only available for PRTG on premises (marked with the PRTG on premises icon), so you cannot use these on PRTG on demand instances.
- Some setup options are only available for PRTG on demand (marked with the PRTG on demand icon), so you cannot use these on PRTG on premises instances.

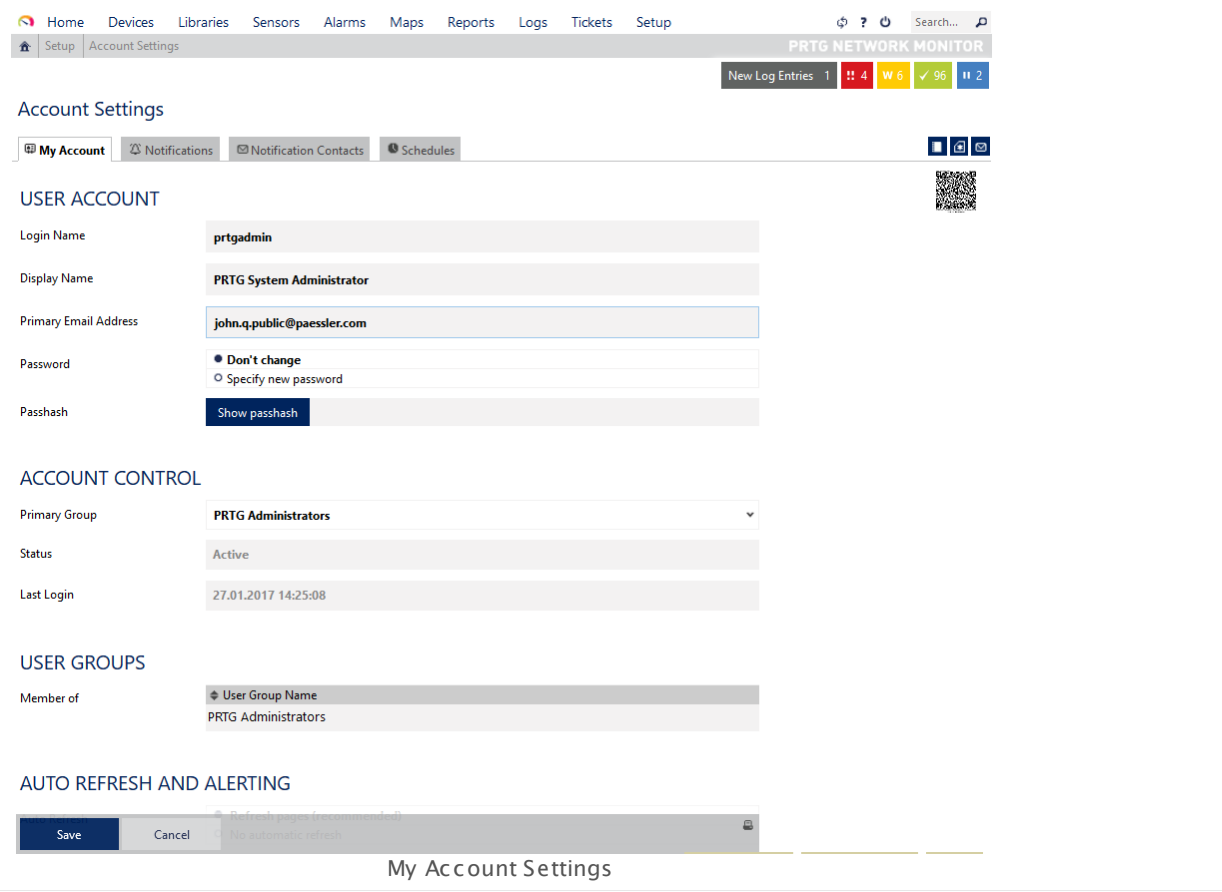
Others

There are some settings that you have to make in the PRTG Administration Tool 3134, running as Windows application. For more details, please see sections PRTG Administration Tool on Core Server System 3135 and PRTG Administration Tool on Remote Probe System 3157.

8.12.1 Account Settings—My Account

In the **My Account** settings you can define values regarding your (currently logged in) PRTG user. All settings in this section are user-specific. Some account options may not be available, but restricted to the administrator.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.



My Account Settings

My Account Settings

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

USER ACCOUNT

Login Name	Enter the login name for the user. This option is not available in PRTG on demand.
Display Name	Enter a name that the user recognizes. It will not be used for login purposes.
Primary Email Address	Enter the user's email address. Please use an email client that can show HTML emails, otherwise you cannot read emails from PRTG.
Password	Define the user password. For security reasons, the account settings page does not contain the password. Choose between: ▪ **Don't change** ▪ **Specify new password** If you choose to specify a new password, enter the old password and then the new password twice. The new password must be at least 8 characters long. It must contain a number and a capital letter. Leading and trailing whitespaces will be cut. The password of a PRTG Administrator user can only be changed by the same PRTG Administrator user. This option is not available in PRTG on demand.
Passhash	Click **Show passhash** to display the passhash for the selected user. You need the passhash of a user if you use the PRTG Application Programming Interface (API). This setting is shown for your information only and cannot be changed here. This option is not available in PRTG on demand.

API ACCESS

These settings are only available in PRTG on demand.

API ACCESS

API Username	Shows the username of the current user account. You need a username if you use the PRTG Application Programming Interface (API) 3174. This setting is shown for your information only and cannot be changed here.
API Passhash	Click **Show passhash** to display the passhash for the selected user. You need the passhash of a user if you use the PRTG Application Programming Interface (API) 3174. This setting is shown for your information only and cannot be changed here.
Reset API Passhash	Click **Generate new passhash** to reset the passhash of the current user.

ACCOUNT CONTROL

Account Type	This setting is only visible to administrator users. However, it will not show if the user who's account you want to modify is a member of a group with administrative rights. Define the account type for the current user. Choose between: ▪ **Read/Write User**: You can change settings. ▪ **Read Only User**: You cannot edit any settings except your own password. This is a good choice for public or semi-public logins. ⓘ This setting cannot be changed for the default administrator user.
Allow Acknowledge Alarms	This setting is only visible if **Read Only User** is enabled above. Acknowledging an alarm is an action that requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may acknowledge alarms 191. Choose between: ▪ **Allow**: Allow acknowledging alarms for this user. ▪ **Deny**: The user will not be able to acknowledge alarms.
Password Changes	Decide if you want the user to be able to change their account's password or not. If you allow the user to change the password, this option will be available in the My Account 2909 settings of the respective user. Choose between: ▪ **User may change his account's password**

ACCOUNT CONTROL

	▪ **Deny the right to change the password** (default) ⓘ This field is only visible if you edit this option for read-only users as an administrator.
Primary Group	This setting is available only for administrator users. Select the primary group for the current user. Every user has to be member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience there is no difference between the primary and other user groups. ⓘ You cannot change the primary group of Active Directory users. Users that you added with **Active Directory Integration** 3171 can only have this AD group as their primary group. If you need to change this, please delete this user account and add it again.
Status	This setting is only shown for administrator users. Define the status of the current user. Choose between: ▪ **Active**: The current user can login to the account. ▪ **Inactive**: The current user's login is disabled. Use this option to temporarily deny access for this user. ⓘ This setting cannot be changed for the default administrator user.
Last Login	Shows the time stamp of the user's last login. This setting is shown for your information only and cannot be changed here.

USER GROUPS

Member of	Shows the groups the current user is member of. Access rights to the device tree are defined on group level. This setting is shown for your information only and cannot be changed here.

AUTO REFRESH AND ALERTING

Auto Refresh	Define if you want PRTG to reload web pages automatically for the current user. Choose between: ▪ **Refresh pages (recommended)**: Automatically refresh the single page elements on the web pages in PRTG. ▪ **No automatic refresh**: Do not automatically refresh web pages.
Auto Refresh Interval (Sec.)	This setting is only relevant if you enable auto refresh above. Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use **30** seconds or more. Minimum value is 20 seconds. Shorter intervals create more CPU load on the server running PRTG. If you experience load problems while using the web interface (or PRTG maps 2885), please set a higher interval.
Play Audible Alarms	Define when PRTG will play an audible alarm the current user on web pages whenever there are new alarms 190. Choose between: ▪ **Never**: Do not play sound files on any web pages. ▪ **On dashboard pages only**: When there are new alarms, play a predefined sound on dashboard 231 pages only. The sound will be played with every refresh of the dashboard page if there is at least one new alarm. ▪ **On all pages**: When there are new alarms, play a predefined sound on all web pages. The sound will be played with every page refresh if there is at least one new alarm. Audible alarms are only played if the **New Alarms** value in the **Global Header Area** 153 of the PRTG web interface is greater than 0 after a page refresh. The number of existing alarms is not considered. For more information about audible notifications and supported browsers, see this Knowledge Base article: Which audible notifications are available in PRTG? Can I change the default sound?

WEB INTERFACE

Homepage URL	Define the user's default page, which is loaded after logging in or clicking on the Home 231 button in the main menu.

WEB INTERFACE

Max. Groups/Devices per Group	To provide a fast and smooth user experience, PRTG attempts to reduce page size when displaying the device tree. It automatically collapses groups and devices when reaching a specified number of items. Enter this threshold for groups and devices here. We recommend values between **10** and **30**.
Max. Sensors per Device	In order to provide a fast and smooth user experience, PRTG attempts to reduce page size when displaying the device tree. It automatically collapses groups and devices when reaching a specified number of items. Enter this threshold for sensors per devices here. We recommend values between **10** and **30**.
Timezone	Define the time zone for the current user. Depending on the time zone you select here, PRTG shows the current user's local time zone in all data tables and graph legends. PRTG receives the UTC (Coordinated Universal Time) from the system time set on the PRTG core server for this purpose.
Date Format	Define the date format for the current user. This setting will take effect after the next login.

TICKET SYSTEM

Email Notifications	Define if you want to get emails from the ticket system. Choose between: ▪ **I want to receive an email whenever a ticket changes**: You will receive an email each time a ticket is assigned to you or your user group, or if a ticket that is assigned to you or your user group is changed. If you edit tickets that are assigned to you or your user group, or you assign a ticket to yourself or your user group, you will not get an email. ▪ **I do not want to receive any emails from the ticket system**: You will not get any emails about tickets.

Notification Contacts

In the **Notification Contacts** 2934 tab you can define recipients for each user account. Recipients can be email addresses, phone numbers, or push devices (iOS, Android and Windows Phone devices with the corresponding PRTG smartphone app 3082).

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

More

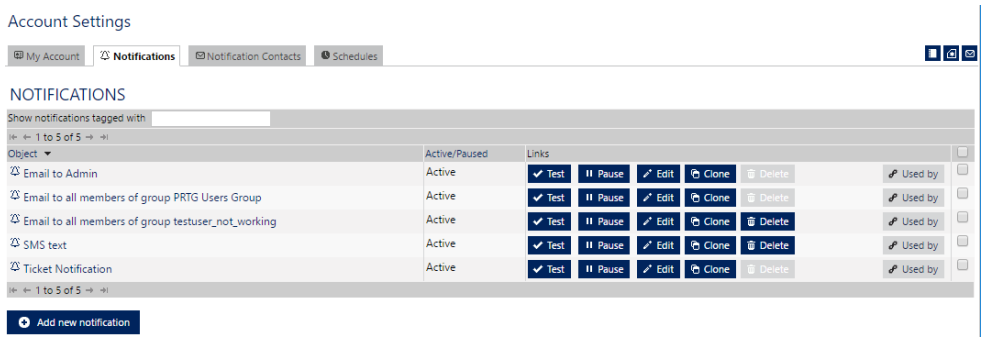
Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- https://kb.paessler.com/en/topic/26303

8.12.2 Account Settings—Notifications

In the notification settings you can define and change notifications for the current PRTG user. Notifications can be triggered for specific sensor states and values.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.



Notification Settings

Click here to enlarge: https://media-s3.paessler.com/prtg-screenshots/account_settings_notifications.png

Note

This section describes one of four steps to set up the notification system in PRTG. A complete notification setup involves:

1. Checking and setting up the **Notification Delivery** settings. This tells PRTG how and where to send messages.
   For detailed information, see **System Administration—Notification Delivery** 2961.
2. Checking and setting up **Notification Contacts** for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** 2934.
3. Checking and setting up **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** 2916.
4. Checking and setting up **Notification Triggers** for objects. This provokes the defined notifications.
   For detailed information, see **Sensor Notifications Settings** 2791.

We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2922 and one SMS notification 2924. If delivery via email fails (due to an email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a state trigger 2793 and a notification via a delivery method other than the one for the first trigger. Or set up a second trigger with another notification for the corresponding object.

For background information, please see the **Notifications** 2829 section.

Notifications Overview

Click the **Notifications** tab to show a list of existing notifications. Using the buttons in the column **Links**, perform the following actions to set up a notification:

- **Test**: Trigger this notification immediately for testing purposes.
  When testing notifications, PRTG will not resolve the placeholders, but rather send the original variables instead.
- **Pause**: Pause this notification. If a notification is paused 214, PRTG will not send messages when this notification is triggered.
- **Edit**: Open the settings of a notification 2917 to edit them.
- **Clone**: Create an exact copy of this notification. The clone 2812 is added to the notifications list as Clone of [...]
- **Delete**: Delete this notification (not possible for predefined notifications).
- **Used by**: Show all objects that trigger this notification.

Please also see **Working with Table Lists** 207. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2814 section.

Notifications Settings

Click the **Add new notification** button to add a new notification, or click the name of an existing notification to edit it.

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

BASIC NOTIFICATION SETTINGS

Notification Name	Enter a meaningful name for the notification, for example, SMS to service team.
Tags	Enter one or more tags 124. Confirm each tag with the space, comma, or enter key. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. Tags will be automatically inherited 124.
Status	Select the status of the notification. Choose between:

BASIC NOTIFICATION SETTINGS

- **Started**: This notification is active. PRTG executes this notification when it is triggered.
- **Paused**: Pause this notification. If a notification is paused, PRTG does not execute this notification when it is triggered.

Schedule

Define intervals for notifications to pause. You might want the notifications to pause for scheduled maintenance periods or regular server reboots at certain intervals. For continuous notification select **None.** This selection will make your notifications be active 24/7 without pause. You can also choose one of the suggested schedules from the list. Usually schedules define when this notification will be active. Schedules defined as period list set this notification to inactive at the corresponding time spans. The available options depend on your setup. To add or change existing schedules, please see **Account Settings—Schedules** 2938.

Postpone

Define whether PRTG should send you notifications that were triggered while the notification was **Paused** later on, when the notification status is in **Started** again.

- **No**: Discard all notifications that are triggered while the notification is paused.
- **Yes**: Collect all notifications that are triggered while the notification is paused. Send out all these notifications once the **Paused** status ends.

NOTIFICATION SUMMARIZATION

Method

Define if and how PRTG summarizes several notifications into one or more messages (max. 1,000 characters). Define if several notification triggers are to be collected over a specified time period and then send as a single summarized notification. Choose between:

- **Always notify ASAP**: Always send out one notification for each received notification trigger as soon as possible (for example, immediately).
- **Send first DOWN message ASAP, then summarize**: When receiving several **DOWN** triggers, send the first notification immediately, then keep summarizing notification triggers into one message, regardless of sensor state.
- **Send first DOWN and UP message ASAP, then summarize**: When receiving several **DOWN** or **UP** triggers, send each first notification immediately, then keep summarizing notification triggers into one message, regardless of sensor state.
- **Send all DOWN messages ASAP, summarize other trigger types**: When receiving several **DOWN** triggers, send out one notification for each trigger received, but summarize notifications for all non-DOWN triggers into one message.
- **Send all DOWN and UP messages ASAP, summarize other trigger types**: When receiving several **DOWN** or **UP** triggers, send out one notification for each trigger received, but summarize the notifications for all non-DOWN and non-UP triggers into one message.
- **Always summarize notifications**: When receiving several notification triggers, summarize notifications, regardless of the kind of trigger received. Please note, the maximum number of notifications (see below) still applies.

Regardless of the option you choose, PRTG always executes notifications of the types **Ticket**, **Execute HTTP Action** and **Execute Program** immediately. PRTG will always send out one message for each of these notifications immediately. All other notification types can be summarized.

'first DOWN' and 'first UP' messages refer to trigger condition and clear condition respectively. You can also define 'WARNING' or 'UNUSUAL' states as trigger conditions or even thresholds or other triggers notification summarizations. The condition clear triggers, if applicable, are defined in the respective trigger conditions as well. The triggers all qualify as "first DOWN" or "first UP" messages.

NOTIFICATION SUMMARIZATION

PRTG collects up to 25 single notifications for one summarization and will send out the message as soon as this number is reached (or when the gathering time has passed). If there are more than 25 notifications within the defined time span, you will receive more than one message with up to 25 entries each. For example, 74 collected notifications would result in 3 summarized messages with 25, 25, and 24 collected notifications.

Subject for Summarized Messages	Define a subject that PRTG will include when sending summarized notifications. You can use the placeholder %SUMMARYCOUNT for the number of messages that are summarized. The subject you define is only used for **Send Email** and **Amazon SNS** messages.
Length of Gathering (Minutes)	Define a time span in minutes to define how long PRTG collects notifications for summarization. Please enter an integer value. If you enter a rather long time span, for example, **60** minutes, PRTG will collect notifications for one hour before sending them out summarized unless other features (see above) require an earlier message dispatch.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists. ▪ **Read**: Users in this group can see the object and review its settings. ▪ **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights. You can create new user groups in the **System Administration—User Groups** 2982 settings.

Notifications Settings—Choose Notification Methods

With the following settings, you can add one or more methods for how PRTG sends out a notification message. You can choose one method or combine several methods from the list. Whenever the notification is triggered, PRTG sends out messages or performs actions for all configured methods at once.

To choose a method, mark the check box in front of the corresponding notification type. You can then see and set the options as described below. The following notification methods are available.

- Email 2922
- Push Notification 2923
- SMS/Pager Message 2924
- Add Entry to Event Log 2926
- Syslog Message 2927
- SNMP Trap Message 2928
- Execute HTTP Action 2929
- Execute Program 2930
- Amazon SNS Message 2930
- Ticket 2931

In your message, you can use various placeholders. Some of them are already filled in by default. For a complete list of available placeholders, please see this Knowledge Base article: What placeholders can I use with PRTG?

Some notification types are only available for PRTG on premises (marked with the PRTG on premises icon). You cannot use these on PRTG on demand instances.

SEND EMAIL

This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under **Account Settings—Notification Contacts** 2935.

The three options for recipients below (user, user group, email address) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification email to the active email contacts of the user you select, to the active email contacts of all members of the user group you select, and to all email addresses you enter into the **Send to Email Address** field.

You can include custom email headers and footers into PRTG HTML emails. For details, please see this Knowledge Base article How can I include my own logo into HTML emails?

Send to User	Select a user of your PRTG installation to send the notification email to. PRTG sends this notification to each email contact of this user account. You can add and edit email contacts of a user in **Account Settings—Notification Contacts** 2935. Choose **None** to not use this feature.
Send to User Group	Select a user group to send an email with the notification to all members of this group. PRTG sends this notification to the email contact of every group member. You can edit user groups under **System Administration—User Groups** 2982 and email contacts under **Account Settings—Notification Contacts** 2935. Choose **None** to not use this feature. If you select a user group and a specific member of this group as recipients, the user will only receive a single email. This also applies if you enter an individual email address below that is already defined as an email contact of the selected user. If you define individual email addresses (see below), to a specific user (see above), and a user group, PRTG sends the message to the individual email addresses, to the individual user, as well as to the members of the selected user group. In all cases, PRTG sends one message with all recipients in the "To" field of the email.

SEND EMAIL

Send to Email Address	Enter one or more recipient email addresses to which PRTG sends the notification email. If you enter more than one address, separate them with commas. Leave this field empty to send this notification only to the email contacts of the user or members of the user group you choose above. We recommend that you use the options **Send to User** and/or **Send to User Group** instead because you can manage the notification contacts of users more easily this way.
Subject	Enter the subject of the email notification. Several placeholders (variables) are used here by default: [%sitename] %device %name %status %down (%message)
Format	Define the kind of email that PRTG sends when the notification is triggered. Choose between: ▪ **HTML**: PRTG uses the default HTML email template for the message part of the email. ⓘ Please use an email client that can show HTML emails, otherwise you cannot read emails from PRTG. ▪ **Text**: PRTG uses the default plain text email template for the message part of the email. ▪ **Text with custom content**: PRTG uses custom plain text for the message part of the email. You can enter your individual text below.
Custom Content	This field is only visible if you select the custom text option above. Enter the desired message for this email notification in plain text format. You can use placeholders here.
Priority	Define the priority that PRTG sets for the email. Most email clients can show this priority flag. Choose between: ▪ **highest** ▪ **high** ▪ **normal** ▪ **low** ▪ **lowest**

SEND PUSH NOTIFICATION

Push notifications only work with the apps **PRTG for Android**[3082], **PRTG for iOS**[3082], and **PRTG for Windows Phone**[3083]. You have to activate push notifications in the settings of your app first. For details about the setup, please see this Knowledge Base article: How can I send push notifications with PRTG?

This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under **Account Settings—Notification Contacts**[2935].

The PRTG server needs to communicate on port 443 to the PRTG Cloud to send push notifications, which is **https://api.prtgcloud.com:443** (the same as for the **Cloud HTTP Sensor**[571], the **Cloud Ping Sensor**[580] and support tickets[3022]).

The two options for recipients below (user, user group) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification to the active push contacts of the user you select and to the active push contacts of all members of the user group you select.

Send to User	Select a user of your PRTG installation to send the push notification to. PRTG sends this notification to each push contact of this user account. You can edit push contacts of a user in **Account Settings—Notification Contacts**[2935] and add push contacts by activating push notifications in the Android or iOS app with this user. Choose **None** to not use this feature.
Send to User Group	Select a user group to send the push notification to all members of this group. PRTG sends this notification to each push contact of every member of this group. You can edit user groups under **System Administration—User Groups**[2982] and push contacts under **Account Settings—Notification Contacts**[2935]. Choose **None** to not use this feature. If you select a user group and a specific member of this group as recipients at the same time, this user receives the text message only one time.
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders[2933] (variables) are used here: [%sitename] %device %name %status %down (%message) You can change the message to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

SEND SMS/PAGER MESSAGE

You have to set up this notification method in the **System Administration—Notification Delivery** 2961 settings first.

This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under **Account Settings—Notification Contacts** 2935.

The three options for recipients below (user, user group, email address) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification to the active SMS contacts of the user you select, to the active SMS contacts of all members of the user group you select, and to every phone number you enter into the **Send to Number** field.

This notification method uses the central proxy settings that you define for your PRTG core server. For details, please see **System Administration—Core & Probes** 2967 (section **Proxy Configuration**).

This option is not available in PRTG on demand.

Send to User	Select a user of your PRTG installation to send the notification to. PRTG sends this notification to each SMS contact of this user account. You can add and edit SMS contacts of a user in **Account Settings—Notification Contacts** 2935. Choose **None** to not use this feature.
Send to User Group	Select a user group to send a text message with the notification to all members of this group. PRTG sends this notification to each SMS contact of every member of this group. You can edit user groups under **System Administration—User Groups** 2982 and SMS contacts under **Account Settings—Notification Contacts** 2935. Choose **None** to not use this feature. If you select a user group and a specific member of this group as recipients at the same time, this user receives the text message only one time. This also counts if you enter an individual phone number below that is already defined as an SMS contact of the selected user.
Recipient Number	Define the number to which PRTG sends the text message. The format depends on the SMS provider. Usually, you use a plus sign "+", followed by country code and number. For example, enter +1555012345. Ensure the number format meets the requirements of your SMS provider or the hardware that you use in combination with an API call. Sometimes a preceded plus sign is not required. A wrong format may result in undelivered messages!

SEND SMS/PAGER MESSAGE

	If you enter more than one number, separate them by comma. Leave this field empty to send this notification only to the SMS contacts of the user or members of the user group you choose above. We recommend that you use the options **Send to User** and/or **Send to User Group** instead because you can manage the notification contacts of users more easily this way.
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here: [%sitename] %device %name %status %down (%message) You can change the message to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

ADD ENTRY TO EVENT LOG

This option is not available in PRTG on demand.

Logfile	Define the log file into which PRTG writes the message. Choose between: ▪ **Application**: Use the Windows application log file in the event log. ▪ **PRTG Network Monitor**: Write messages to the PRTG Network Monitor log file in the Windows event log.
Event Source	This setting is only relevant when using the **Application** log file. Enter the source for the event. Usually, this is the name of the application.
Event Type	Select the type of the event. Choose between: ▪ **Error** ▪ **Warning** ▪ **Information**

ADD ENTRY TO EVENT LOG

Event Log Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

SEND SYSLOG MESSAGE

This option is not available in PRTG on demand.

Host/IP	Define the IP address or DNS name of the computer running the syslog server. You can receive and analyze syslog messages with the **Syslog Receiver Sensor**.
Syslog Port	Enter the port number on which syslog messages are sent. By default, this is port number **514**. Only User Datagram Protocol (UDP) is supported.
Facility	Define the facility information. There are several options available from the list.
Encoding	Define the encoding of the syslog message that PRTG sends to your syslog receiver. Choose between: ▪ **ANSI** ▪ **UTF-8**
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

SEND SYSLOG MESSAGE—SYSLOG MESSAGE SEVERITY STATUS

Depending on the status of the sensor that triggers the syslog notification, PRTG sets the **Severity** level of the message automatically.

OK	Severity level: Notice (5)
Warning	Severity level: Warning (4)
Error	Severity level: Error (3)

SEND SNMP TRAP

For information about the OIDs that PRTG uses in the content of the SNMP traps, please see this Knowledge Base article: Is it possible to send SNMP traps using PRTG?

This option is not available in PRTG on demand.

Host/IP	Define the IP address or DNS name of the computer running the trap receiver. You can receive and analyze SNMP trap messages with the **SNMP Trap Receiver Sensor**.
SNMP Port	Enter the port number on which trap messages are sent. By default, this is port number **162**.
Community String	Enter the community string of the device. By default, this is set to **public**. Please enter a string or leave the field empty.
Specific Trap Code	Enter a code that can help you identify the purpose of the trap. Default value is **0**. Please enter an integer value.
Message ID	Enter an ID that helps you identify the origin of the trap. Please enter an integer value. PRTG sends it on the OID 1.3.6.1.4.1.32446.1.1.1.

SEND SNMP TRAP

Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).
Agent IP	Define the IP address of the agent. Leave this field empty to use the IP address of your PRTG web server.

EXECUTE HTTP ACTION

Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Execute HTTP Action** always as soon as possible (ASAP). They are never summarized.

This notification method uses the central proxy settings that you define for your PRTG core server. For details, please see **System Administration—Core & Probes** (section **Proxy Configuration**).

For more details, please see the PRTG **Application Programming Interface (API) Definition** in your PRTG web interface. You can find ready-to-use custom notifications in the PRTG Script World, please see below.

URL	Enter the URL to which PRTG sends the request. HTTP notifications work with and without SSL.
SNI (Server Name Indication)	Select if PRTG will send the SNI extension to the TLS protocol along with the HTTP request. Choose between: ▪ **Do not send SNI (default)**: PRTG will not send an SNI when executing the HTTP action. ▪ **Send SNI**: PRTG will send an SNI when calling the target URL. Specify the SNI below.
Virtual Host (SNI)	This field is only visible if you select the SNI option above. Enter the SNI name that your endpoint configuration requires. Usually, this is the Fully Qualified Domain Name (FQDN) of the virtual host.
Postdata	Enter postdata if you want to send this data to the URL. You can use placeholders here. Line breaks are supported.

EXECUTE PROGRAM

Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Execute Program** always as soon as possible (ASAP). They are never summarized.

For more details about **Custom Notifications**, please see the **Application Programming Interface (API) Definition** 3174 in your PRTG web interface. You can find ready-to-use custom notifications in the PRTG Script World, please see below 2932.

This option is not available in PRTG on demand.

Program File	Select an executable file from the list. PRTG runs it every time the notification is triggered. In this list, you see the files which are in the corresponding **/Notifications/EXE** sub-directory of your PRTG core server system. To appear in this list, store the files as BAT, CMD, DLL, EXE, PS1, or VBS. To find this path, please see section **Data Storage** 3226. In a cluster setup, copy your files to every cluster node installation manually. This makes sure PRTG can execute the notification even when the master node fails. If your custom notification executes an external program, install it on all cluster nodes as well.
Parameter	Enter parameters with which the program file will be started. You can use placeholders 2933 here. For example, is you use a batch file that contains a %1 variable, you can provide a value for this variable here.
Domain or Computer Name	Enter a Windows authority if you want to use another security context for the program than the security context of the PRTG probe service.
Username	Enter the username for Windows access.
Password	Enter the password for Windows access.
Timeout	Enter a timeout in seconds. After this time has passed, PRTG stops the process if it has not terminated yet. Please enter an integer value.

SEND AMAZON SIMPLE NOTIFICATION SERVICE MESSAGE

AWS Access Key ID	Enter your access key as shown in your login area at aws.amazon.com. Please enter a string.
AWS Secret Access Key	Enter your secret access key as shown in your login area at aws.amazon.com. Please enter a string.
Location	Define the location of your Amazon service. Choose one of the shown locations: ▪ US-East (Northern Virginia) ▪ US-West (Northern California) ▪ EU West (Ireland) ▪ US West (Oregon) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ South America (Sao Paulo) ▪ EU Central (Frankfurt)
ARN	Enter the Amazon resource name. Please enter a string.
Subject	Enter the subject of the message. Please enter a string. ⓘ The maximum length for the subject is 202 characters. Characters that exceed this number will be cut off.
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders 2933 (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else). ⓘ The message part is only sent if you use email based notifications delivered by Amazon SNS. For SMS delivery, only the subject is sent while the message part is ignored because of SMS size restrictions.

ASSIGN TICKET

Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Assign Ticket** always as soon as possible (ASAP). They are never summarized.

For details about the ticket system, please see manual section **Tickets** 200.

Assign to User or User Group	Specify whether to assign the notification ticket to a user group or to a single user. Choose between: ▪ **To User Group**: Select a user group below to which PRTG assigns this ticket. ▪ **To User**: Select the dedicated user below to whom PRTG assigns this ticket.
Assign Ticket to this User Group / User	Select the user resp. user group to which PRTG assigns the notification ticket.
Subject	Enter the subject of the ticket. Several placeholders (variables) are used here by default. You can change it to your liking.
Content	Define the message in the ticket. A message with information about the sensor status is already predefined. Several placeholders 2933 (variables) are used here. You may change it as you wish.
When Condition Clears	Specify if PRTG closes the ticket automatically when the defined trigger condition clears. Choose between: ▪ **Close ticket automatically (recommended)**: PRTG closes the ticket automatically if the trigger condition is not met anymore. ▪ **Leave ticket open**: PRTG does not close the ticket after the condition has cleared.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Script World Notifications

In addition to the built-in notification, you can create your own notifications. Just write a script or a program and use it with an **Execute Program** notification or execute an HTTP action. There are already many free, useful scripts, plugins, and add-ons for PRTG in the **PRTG Script World** available for download. Here is a list of the custom notifications that you can find there.

8.12.3 Account Settings—Notification Contacts

In the notification contacts settings you can define and change notification contacts for the currently logged in PRTG user. Notifications contacts contain information about how and where to PRTG will send you notifications 2829. They are unique for each user account. Recipients of notifications can be email addresses, phone numbers (PRTG on premises only), and push devices (these are Android 3082 or iOS 3082 devices or a Windows Phone 3083 with the corresponding PRTG app). This way, every user with a PRTG installation can individually define how and where to receive messages from PRTG.

When you set up one of the notification methods 2921 **Send Email**, **Send SMS/Pager Message**, or **Send Push Notification**, you can choose a PRTG user to send a notifications to all **active** notification contacts of this user. If you select a user group, PRTG sends the notification to all contacts of all users that this group contains. A user can also pause one or more of the contacts to temporarily not receive any messages with this recipient.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Note

This section describes one of four steps to set up the notification system in PRTG. A complete notification setup involves:

1. Checking and setting up the **Notification Delivery** settings. This tells PRTG how and where to send messages.
   For detailed information, see **System Administration—Notification Delivery** 2961.
2. Checking and setting up **Notification Contacts** for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** 2934.
3. Checking and setting up **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** 2916.
4. Checking and setting up **Notification Triggers** for objects. This provokes the defined notifications.
   For detailed information, see **Sensor Notifications Settings** 2791.

We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2922 and one SMS notification 2924. If delivery via email fails (due to an email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a state trigger 2793 and a notification via a delivery method other than the one for the first trigger. Or set up a second trigger with another notification for the corresponding object.

For background information, please see the **Notifications** 2829 section.

Notification Contacts Overview

Click on the **Notification Contacts** tab to show a list of all existing notification contacts of the currently logged in PRTG user. Using the buttons in the particular contact rows, you can do the following:

- **Pause**: Pause this notification contact. If a notification contact is paused 214, PRTG does not send any messages to this contact when a notification for this user is triggered.
- **Edit**: Open the settings of this notification contact 2935 and change its description and recipient.
  This is not possible for predefined notification contacts, for example, the primary email address. You can change the primary email address under **Account Settings—My Account** 2909.
- **Delete**: Delete this notification contact.
  This is not possible for predefined notification contacts, for example, the primary email address.

Notification Contacts Settings

Click **Add Email Contact** button or **Add SMS Contact** button (PRTG on premises only) to add a new notification contact, or click the **Edit** button of an existing notification contact to edit it. A dialog box appears where you can enter the contact settings.

PRTG adds push contacts automatically for the corresponding user when you install a PRTG mobile app on your smartphone or tablet, connect to the PRTG server, and activate push notifications. You cannot add push contacts manually. If your mobile device rejects push notifications actively for an existing push contact, for example, because you deactivated push on the target device or reset it, the PRTG server will pause this contact automatically. The affected PRTG user account will receive a ToDo ticket 201 in this case.

ADD NEW / EDIT NOTIFICATION CONTACT

Description	Enter a meaningful name for the notification contact, for example, SMS to Admin Mobile or similar.
Recipient	Enter a valid email address for the contact type **Email**. On PRTG on premises instances you can add an **SMS** contact by entering a valid phone number. The format of the phone number depends on the SMS provider. Usually, you use a plus sign "+", followed by country code and number. For example, enter +1555012345 Ensure the number format meets the requirements of your SMS provider or the hardware that you use in combination with an API call. Sometimes a preceded plus sign is not required. A wrong format may result in undelivered messages!

ADD NEW / EDIT NOTIFICATION CONTACT

	For the contact type **Push**, this field shows a unique token that you cannot change here. This token is needed to send push notifications through the cloud. For details, see this Knowledge Base article: How can I use push notifications with PRTG?
Contact Type	Shows the type of contact, either **Email**, **SMS** (PRTG on premises only), or **Push**. This setting is shown for your information only and cannot be changed here. If you want to use another contact type, create a new contact with **Add Email Contact** or **Add SMS Contact** (PRTG on premises only), or activate push notifications in your PRTG for iOS, Android, or Windows Phone app.

Click the **Save** or **Add** button to save your settings, or click **Cancel** to close the dialog box without changes to your configuration.

A cloud contact is added automatically when you install the PRTG app on your smartphone, connect to the PRTG server, and enable push notifications.

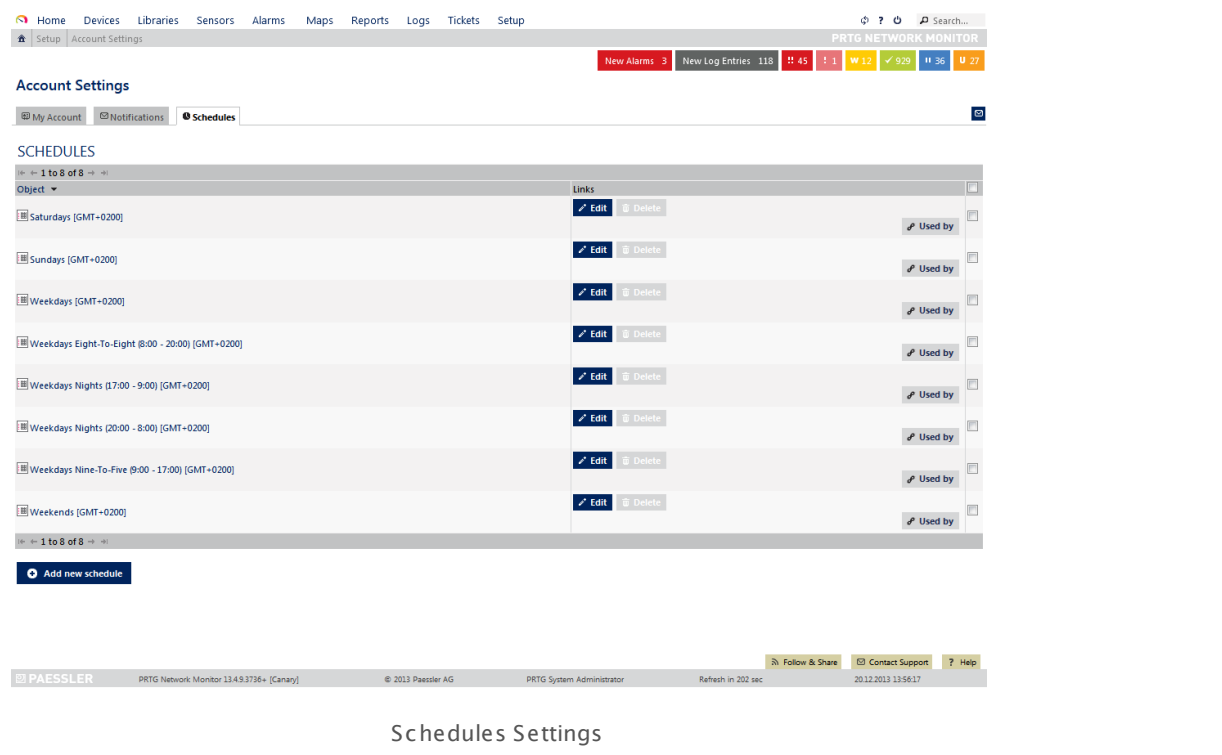
- PRTG Administration Tool on Remote Probe System 3157

8.12.4 Account Settings—Schedules

In the schedule settings you can define or change schedules for the currently logged in user. You can use schedules to pause 214 monitoring/notification at for certain time periods with the period lists option. Also you can activate it at certain times with the time table option. You can also use schedules to define the time periods that are to be covered when creating reports 2862 .

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.



Schedules Settings

Schedules Settings

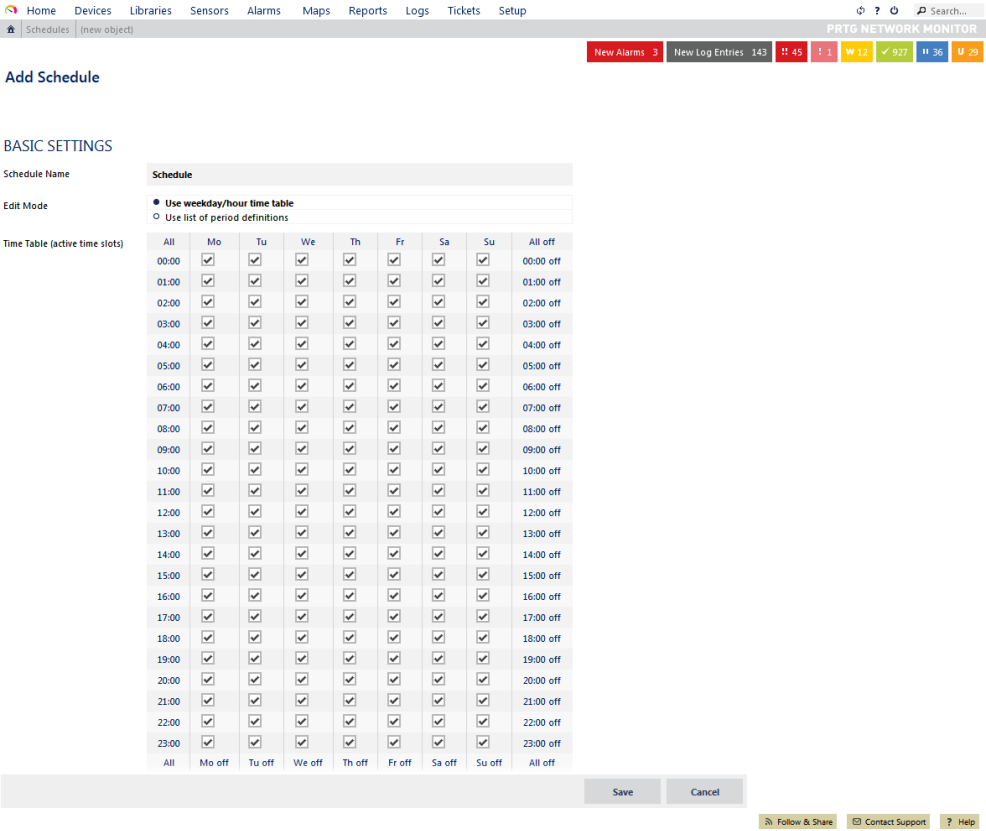
This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Click on the **Schedules** tab to show a list of all existing schedules. By following the links next to the notification name, you can perform the following actions:

- **Delete**: Delete this notification (not possible for predefined notifications)
- **Used by**: Show a list of objects using this notification.

Please also see Working with Table Lists 207. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the Multi-Edit Lists 2814 section.

Click the **Add new schedule** button or click the name of an existing notification to edit.



Edit Schedule Time Table

BASIC SETTINGS

Schedule Name	Enter a meaningful name for the schedule that describes the defined time span(s) or their purpose.
Edit Mode	Select how you want to define a schedule. Choose between: ▪ **Use weekday/hour time table**: Define a schedule by adding check marks to available checkboxes. The lowest possible increment is one hour. ⓘ This time table defines which time slots are active.

BASIC SETTINGS

- **Use list of period definitions**: Define a schedule by entering text lines using a specific syntax (see below).
  This time table defines which time slots are inactive.

Time Table

This selection is only visible if you enable the time table option above. Define the schedule. It will be used for monitoring objects, reporting, and notifications.

You can set time spans with a precision of one full hour by adding check marks. If a box is checked, it means the object is active during this hour, if unchecked, the object will be paused during this hour. You can set check marks individually, or change complete ranges for certain days of the week or time spans.

- To add ranges of check marks, use the buttons **All**, **Mo**, **Tu**, **We**, **Th**, **Fr**, **Sa**, and **Su**, as well as the time buttons on the left side.
- To remove ranges of check marks, use the buttons **All Off**, **Mo Off**, **Tu Off**, **We Off**, **Th Off**, **Fr Off**, **Sa Off**, and **Su Off**, as well as the time **Off** buttons on the right side.

Period List

This field is only visible if you enable period definitions above. Define the date/time ranges in which the objects using this schedule will be inactive (for example, paused). During other times, the objects will be active. Enter the ranges in this format:

- **ww:hh:mm-ww:hh:mm**

Ensure you enter each period exactly in the required syntax! Otherwise you will receive an error message. Please go back to the schedule and correct the according entry in this case.

For details and examples, see Schedules Settings—Period Definition Syntax 2941 below.

Schedules use the time zone of the computer on which your PRTG core server is running. This may diverge to other time displays in PRTG which are saved in UTC.

- If you define a schedule with the Time Table option in the schedule settings 2939, the time to which the schedule applies is converted to the time zone of your PRTG user account 2913. This means that the schedule is executed according to the time that your user account shows.
- If you use the Period List option, PRTG will not adjust the schedule to the time zone of your user account! The schedule will apply according to the time on your PRTG server in this case. Because of this, you will encounter time shifts for schedules if there are changes to the time zone on the server or in case of different daylight saving and standard time changes.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and rights is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists. ▪ **Read**: Users in this group can see the object and review its settings. ▪ **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights. You can create new user groups in the **System Administration—User Groups** 2982 settings.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Schedules Settings—Period Definition Syntax

Define one or more periods of time during which the object using this schedule will be inactive. In each line, enter one range in the format ww:hh:mm-ww:hh:mm: weekday, hour, minute.

- **Possible values for** ww: mo, tu, we, th, fr, sa, su.
- **Possible values for** hh: Enter the hour in 24 hour format (no AM/PM allowed), for example, a number between 00 and 23.
- **Possible values for** mm: Enter the minute, for example, a number between 00 and 59.

Example

This example shows a schedule that pauses an object during the weekend as well as on Wednesday evenings.

```
fr:19:30-mo:06:05
we:18:45-we:23:00
```

Any object using this schedule will be paused from Friday, 7:30 p.m. to Monday, 6:05 a.m. as well as on Wednesday from 6:45 p.m. to 11 p.m. It will be active during the other times.

Others

For information about the comments and history tabs, see the **Object Settings** 188 section.

8.12.5 System Administration—User Interface

In the user interface settings you can define global values regarding the PRTG web site appearance, PRTG web server settings and performance, geo maps, and graph settings.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

User Interface Settings

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

WEBSITE

PRTG Site Name	When using the web interface, the site name is shown in the title bar of your browser window. It is also used by default in notification emails. Please enter a string.
DNS Name	If your PRTG web interface is (additionally) reachable via a DNS name, enter it here. It is used, for example, by default in notification emails to generate links. Please enter a string. This option is not available in PRTG on demand.
Website Language	Choose the system language from the dropdown list. Default is **English**. Depending on your installation, you may be able to choose other languages here. This setting defines the language of the PRTG web interface 136, as well as of the **PRTG Administration Tool** 3134. If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the **Enterprise Console** 3028, or of **PRTG Apps for Mobile Network Monitoring** 3082 will be disconnected and reconnected.
Graph Type	Select how graphs will be displayed throughout the web interface and in reports 2862.

WEBSITE

- **Use area graphs (recommended)**: Display filled graphs.
- **Use line graphs**: Display graphs using single lines only.

We recommend using area charts, as they're better to read.
Graphs containing data from more than one cluster node will always be displayed with line graphs automatically.

Automatic Logout

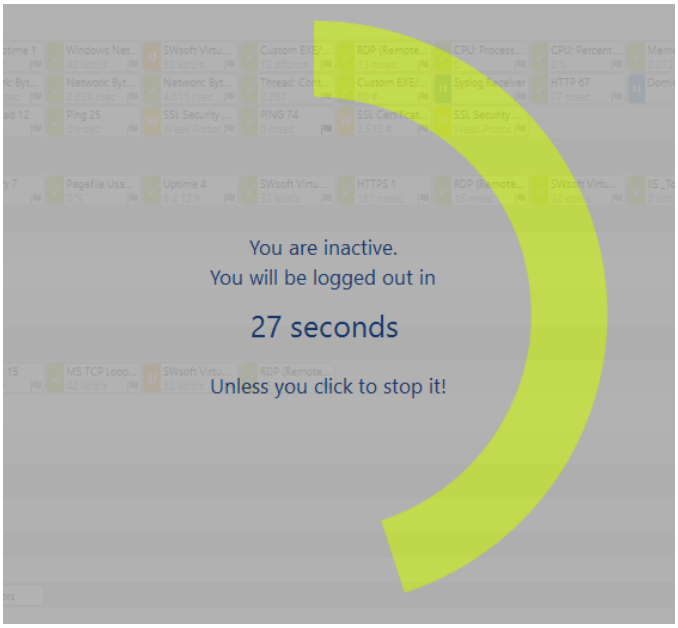
Define if a user who is inactive for a certain period of time will be logged out from the PRTG interface automatically for security reasons. Choose between:

- **Keep user logged in, even for a longer period of inactivity.**
- **Logout user automatically after a certain period of inactivity.**

Automatic Logout after Minutes

This field is only visible if you select the logout option above. Specify in minutes after which time of inactivity a user will be logged out automatically. Please enter an integer value. PRTG will redirect to the login page once this time has expired.

If the value you enter here is greater than 1 minute, a logout countdown will appear 1 minute before you are logged out. If the value is 1 minute, you will see the logout countdown 30 seconds before you are logged out. Click into the browser to stop the countdown and stay logged in.



Logout Countdown

WEBSITE

Google Analytics Tracking ID

You can track the usage of PRTG web pages with Google Analytics by entering your Google Universal Analytics Tracking ID into this field. You need a Google Analytics account for this feature. Create a tracking ID within the Google Analytics portal and provide it here. PRTG will then dynamically integrate it into the website.

Please enter a string or leave the field empty. The string will look like this: **UA-xxxxxx-xx**

For details, please see this Knowledge Base article: How can I integrate Google Analytics in PRTG?

This option is not available in PRTG on demand.

GEO MAPS

Map Service Provider

Select if and how you want to integrate the Geo Maps feature into the web interface. If enabled, PRTG uses the first line of the location setting of an object to show it on a geographical map. Please choose a map provider:

- **Do not show maps (disables Geo Maps integration)**: Disable Geo Maps integration and do not show geographical maps in the web interface.
- **Default (recommended)**: The recommended default option currently reroutes the map requests to Nokia Maps. See this blog article for details: **Geo Maps Requires a Change of Map Service Provider**
- **Nokia Maps**: Use Nokia Maps to show geographical maps.
- **CloudMade (API key required)**: Use CloudMade to show geographical maps. Please sign up for an API key on their developer website to use this service.
- **Google Static Maps (API key required)**: Use Google Static Maps to show geographical maps. Please sign up for a Google Maps **API v3 key** to use this service as of PRTG version 13!

For more information about the different map providers, please see this Knowledge Base article: Which provider should I use for PRTG's "Geo Maps" feature?

GEO MAPS

Map Type	This setting is only visible for some map providers. Depending on the chosen provider, several options are shown. Each will show map tiles in a different appearance. Please choose a map type from the list.
API Key (required)	This field is only visible if you selected a provider that requires an API key. Please obtain your personal key and paste it here. For more information on how to get a Google API key, please see this Knowledge Base article: How do I get a Google Maps API key for use in PRTG?

WEB SERVER

Performance Strategy	Select if you want to enable performance improvements for the web interface. ▪ **All Features: Show all features and live data (recommended)**: Provide full functionality and show all menu items. ▪ **More Speed: Limit features and delay display (experimental)**: Improve reaction time and speed of the web interface by delaying display of monitoring data and hiding some features. For more information on how to speed up the web interface, please see this Knowledge Base article: How can I speed up PRTG—especially for large installations?
IP Address for Web Server	PRTG is running a web server in order to provide access via the web and Windows interface. Please specify the IP address this web server will run on. Later, you can log in to PRTG by simply pointing your browser to the specified IP address. Choose between: ▪ **Localhost, 127.0.0.1 (PRTG will not be accessible from other computers)**: Use 127.0.0.1 only. The PRTG web interface and the Enterprise Console will only be accessible from the computer PRTG is installed on. Either the selected port or at least one port in the range from **8080** to **8089** has to be available on 127.0.0.1. If you run PRTG on localhost, please do not use the DNS name http://localhost to log in to the web server, as this may considerably slow down the PRTG web interface. Please use your local IP address or http://127.0.0.1 instead.

WEB SERVER

- **All IPs available on this computer**: Use all IP addresses available on this computer and enable access to the web server for all of these addresses. The TCP port selected below must be free on every available IP address.

- **Specify IPs**: Select specific IP addresses on which the PRTG Web server will run. A list specific to your system is shown. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select and deselect all addresses by clicking on the check box in the table header. Either the selected port or at least one port in the range from **8080** to **8089** has to be available on the specified IP address.

Regardless of the selected setting above, one port in the range from **8080** to **8180** has to be available on the specified IP address so PRTG can create reports. The report engine will try to connect to the core server on one of these ports.

If PRTG does not find a network card on startup it will switch the IP setting to **Localhost**. This setting will remain, even if a network card is available later on. If you disabled or removed the network card on the machine running the PRTG core server, please re-check this setting.

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the [Enterprise Console](3028), or of [PRTG Apps for Mobile Network Monitoring](3082) will be disconnected and reconnected.

This option is not available in PRTG on demand.

TCP Port for Web Server

PRTG runs a web server in order to provide access via the web interface and the Enterprise Console. Please specify on which port this web server will run. Choose between:

WEB SERVER

- **Secure HTTPS server (recommended, mandatory for internet access)**: We recommend this setting and you need it to access the PRTG server via the internet. Use a secure HTTPS connection that is encrypted via SSL on port 443.
  Although the connection is secure, you will see an SSL Certificate Warning 142 in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see Using Your Own SSL Certificate 3228.

  If port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to port 443 via HTTPS. You can change this behavior by using a registry setting.
  If port 443 is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG will send a ticket 200 that shows you the currently used port number and will switch back to 443 as soon as it is available again.
- **Insecure HTTP server (standard port 80, not recommended)**: Use a standard web server without SSL encryption on port 80. This setting is not recommended for WAN connections.
  If you use an insecure web server on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.
- **Expert configuration**: This setting allows you to specify a custom web server port and the security of the connection. This option is intended for systems with an existing web server on the standard port. Define port and encryption below.
  If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft IIS web server also uses the port 80 (443 for SSL) by default and blocks it. Please disable such programs and services on startup.

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the Enterprise Console 3028, or of PRTG Apps for Mobile Network Monitoring 3082 will be disconnected and reconnected.

This option is not available in PRTG on demand.

WEB SERVER

Web Server Port

You will see this setting only if you select **Expert configuration** above. Enter the TCP port number you want the PRTG web server to run on. Please enter an integer value.

If you use a secure connection and port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will be redirected to the custom port via HTTPS. You can change this behavior by using a registry setting.

If the defined port for a secure connection is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG sends a ticket [200] that shows you the currently used port number and will switch back to the original port as soon as it is available again.

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the **Enterprise Console** [3028], or of **PRTG Apps for Mobile Network Monitoring** [3082] will be disconnected and reconnected.

This option is not available in PRTG on demand.

Web Server Security

You will see this setting only if you select **Expert configuration** above. Specify if you want to use an SSL encryption. Choose between:

- **Use SSL encryption (HTTPS)**: Use a secure HTTPS connection that is encrypted via SSL on a custom port as defined above.
  Although the connection is secure, you will see an **SSL Certificate Warning** [142] in your browser when you log in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see **Using Your Own SSL Certificate** [3228].
- **Don't use encryption (not recommended)**: This setting is not recommended for WAN connections. Use a standard web server without SSL encryption on a custom port as defined above.

If you use a web server without encryption on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.

WEB SERVER

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the Enterprise Console 3028, or of PRTG Apps for Mobile Network Monitoring 3082 will be disconnected and reconnected.

This option is not available in PRTG on demand.

SSL Security

Specify the security level which will be used for SSL connections from and to the PRTG web server. Choose between:

- **High security (recommended)**: The web server will only accept high security connections from clients like web browsers, apps 3082, the Enterprise Console 3028, or API clients. These clients must be able to support modern ciphers which support authentication and encryption of 128 bits or stronger and forward secrecy. All modern web browsers do this.
- **Weakened security (necessary for old web browser and old client software)**: If you have clients which do not support the high security setting, you can choose this 'normal security level' setting to connect (for example, older browsers, browsers running on Windows XP, some default browsers on Android systems). However, we strongly recommend that you update your clients in this case.

This option is not available in PRTG on demand.

Currently Active IP Address/Port Combination(s)

Shows all currently active combinations of IP addresses and ports on which the PRTG server listens for web requests. This setting is shown for your information only and cannot be changed here.

PRTG internally uses port 8085 for report generation.

This option is not available in PRTG on demand.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

PRTG shows several graphs in the objects' detail pages 166 in the web interface. These are kept in RAM memory for fast display without causing extra CPU load or disk usage. The longer the time frames and the shorter the intervals are, the more memory will be used for this. You can adapt the details for all four graphs. This setting will also change the caption of the objects' tabs in the web interface 136 and Enterprise Console 3028.

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the **Enterprise Console** 3028, or of **PRTG Apps for Mobile Network Monitoring** 3082 will be disconnected and reconnected.

Live Graph	The live graph is available for sensors only. For the live graph, no fixed time span is given, but you can define how many values will be displayed. The actual time span covered by the live graph depends on the scanning interval set for the sensor you're viewing and is calculated automatically. By default, **120 Values** is set, which results in a graph covering a time span of two hours, if a scanning interval of 60 seconds is set for the sensor. Other scanning intervals will result in graphs covering different time spans. Choose between: ▪ **60 Values**: This corresponds to a live graph covering a time span of one hour if a 1 minute scanning interval is set. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more. ▪ **120 Values**: This corresponds to a live graph covering a time span of two hours if a 1 minute scanning interval is set. ▪ **240 Values**: This corresponds to a live graph covering a time span of four hours if a 1 minute scanning interval is set. ▪ **480 Values**: This corresponds to a live graph covering a time span of eight hours if a 1 minute scanning interval is set. ▪ **960 Values**: This corresponds to a live graph covering a time span of 16 hours if a 1 minute scanning interval is set. Uses most RAM memory.
Graph 1	By default, this is the **2 days** graph in the web interface. You can change it to more or less detail by choosing a time span and a monitoring interval average associated with it. Monitoring results will be averaged regardless of the actual scanning interval set for the sensors. Choose between: ▪ **1 day with 1 minute averages**: Results in 1440 values. ▪ **1 day with 5 minutes averages**: Results in 288 values.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

	▪ **1 day with 15 minutes averages**: Results in 96 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more. ▪ **2 days with 1 minute averages**: Results in 2880 values. Uses most RAM memory. ▪ **2 days with 5 minutes averages**: Results in 576 values. ▪ **2 days with 15 minutes averages**: Results in 192 values. ▪ **4 days with 1 hour averages**: Results in 96 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.
Graph 2	By default, this is the **30 days** graph in the web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose between: ▪ **10 days with 1 hour averages**: Results in 240 values. ▪ **20 days with 1 hour averages**: Results in 480 values. ▪ **30 days with 1 hour averages**: Results in 720 values. ▪ **30 days with 6 hour averages**: Results in 120 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more. ▪ **40 days with 1 hour averages**: Results in 960 values. ▪ **40 days with 6 hour averages**: Results in 160 values. ▪ **60 days with 1 hour averages**: Results in 1440 values. Uses most RAM memory. ▪ **60 days with 6 hour averages**: Results in 240 values.
Graph 3	By default, this is the **365 days** graph in the web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose between: ▪ **100 days with 1 day averages**: Results in 100 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more. ▪ **200 days with 1 day averages**: Results in 200 values. ▪ **365 days with 1 day averages**: Results in 365 values.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

- **400 days with 1 day averages**: Results in 400 values.
- **750 days with 1 day averages**: Results in 750 values. Uses most RAM memory.

REPORT COMMENTS

Introduction	Define a custom text that will show up on the first page of the report. Please enter a string or leave the field empty.
Footer Comments	Define a custom text that will show up on the last page of the report. Please enter a string or leave the field empty.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.12.6 System Administration—Monitoring

In the monitoring settings you can define global values regarding scanning intervals, unusual and similar sensors detection, auto-discovery, and uptime threshold.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Monitoring Settings

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

SCANNING INTERVALS

This option is not available in PRTG on demand.

Available Intervals	Define the intervals available in the dropdown list of every object's settings 188. In the text field, enter one value in each line. Use **s**, **m**, **h**, and **d** for defining seconds, minutes, hours, and days. By default, there are the following scanning intervals defined: **30s**: 30 seconds **1m**: 1 minute **5m**: 5 minutes **10m**: 10 minutes **15m**: 15 minutes **30m**: 30 minutes **1h**: 1 hour **4h**: 4 hours **6h**: 6 hours **12h**: 12 hours **1d**: 1 day

SCANNING INTERVALS

We recommend that you do not use intervals shorter than 10 seconds to prevent system overload. Intervals below 10 seconds are not officially supported! The maximum supported scanning interval is 10 days.

You can also define specific points in time to indicate when PRTG executes scanning actions. Enter up to 50 concrete UTC points in time according to the formula

@ UTC hh:mm, hh:mm

Your local time may be different from the UTC time!

For more information on how to set specific points in time as a scanning time for sensors, see this Knowledge Base article: Can I set a sensor to run at a specific time?

UNUSUAL DETECTION

The unusual detection can set sensors to an **Unusual** status 163 when there are values that are untypical for the time span in which they are measured. PRTG compares the current average values to the historic monitoring results for this purpose. If the current values show a big difference to the values that are normally retrieved by a sensor, this sensor will indicate this with the unusual status.

You can define the granularity of the unusual detection here (this means, how big the difference must be to cause an unusual status). If you disable the unusual detection (both settings to **Never**), sensors will never show an unusual status.

You can enable and disable unusual detection for specific devices, entire groups, and probes in the respective **Object Settings** 188.

Show Unusual When	Define when a sensor shows the unusual status, comparing the weekday. If you enable the detection here, the average of the values which were measured on the day before is compared to the average of the same weekday in previous weeks. Choose between: ▪ **Never**: Disable unusual detection for weekday average. ▪ **24h average is <80% or >120% of weekday average**: The average of the values measured on the day before is either lower than 80% or higher than 120% than usually on the same weekday.

UNUSUAL DETECTION

- **24h average is <50% or >200% of weekday average**: The average of the values measured on the day before is either lower than 50% or higher than 200% than usually on the same weekday.
- **24h average is <20% or >500% of weekday average (recommended)**: The average of the values measured on the day before is either lower than 20% or higher than 500% than usually on the same weekday.
- **24h average is <10% or >1,000% of weekday average**: The average of the values measured on the day before is either lower than 10% or higher than 1,000% than usually on the same weekday.
- **24h average is <1% or >10,000% of weekday average**: The average of the values measured on the day before is either lower than 1% or higher than 10,000% than usually on the same weekday.

For example, consider a traffic sensor that usually measures 100 MB average traffic on a weekday. If you choose the first option, it would show an unusual status if the average from the day before is below 80 MB or above 120 MB.

Show Unusual When

Define when a sensor shows the unusual status, comparing the hour-of-day. If you enable the detection here, the average of the values which were measured in the hour before is compared to the average of the same hour on the same weekday in previous weeks. Choose between:

- **Never**: Disable unusual detection for hour-of-day average.
- **Hourly average is <80% or >120% of hour-of-day average**: The average of the values measured in the hour before is either lower than 80% or higher than 120% than usually in this hour of this weekday.
- **Hourly average is <50% or >200% of hour-of-day average**: The average of the values measured in the hour before is either lower than 50% or higher than 200% than usually in this hour of this weekday.
- **Hourly average is <20% or >500% of hour-of-day average (recommended)**: The average of the values measured in the hour before is either lower than 20% or higher than 500% than usually in this hour of this weekday.
- **Hourly average is <10% or >1,000% of hour-of-day average**: The average of the values measured in the hour before is either lower than 10% or higher than 1,000% than usually in this hour of this weekday.

UNUSUAL DETECTION

- **Hourly average is <1% or >10,000% of hour-of-day average**: The average of the values measured in the hour before is either lower than 1% or higher than 10,000% than usually in this hour of this weekday.

Consider a traffic sensor that usually measures 10 MB average traffic within an hour. If you choose the first option, it would show an unusual status if the average from the hour before is below 8 MB or above 12 MB.

Logging

Define if unusual events will be written to the log file. Choose between:

- **Do not log unusual events**
- **Write unusual events into the log**

SIMILAR SENSORS DETECTION

Similar sensors detection enables PRTG to analyze sensor data for similarities. The detection will run in the background with low priority. The recommended setting for similar sensors detection is to let PRTG automatically decide how many channels will be analyzed. However, you can also override this setting.

When similar sensors analysis is turned off or you have exceeded 1,000 sensors and have chosen the automatic analysis depth option, the similar sensors entry will not be shown in the main menu bar.

Analysis Depth

Define the number of channels PRTG will analyze to detect similarities between sensors or turn the analysis off. Choose between:

- **Manage automatically based on sensor count (recommended)**: The analysis depth depends on the total number of sensors you have configured. PRTG will analyze all channels for up to 500 sensors, and only the primary sensor channels for up to 1,000 sensors. If exceeding 1,000 sensors, the analysis will be turned off.
- **Analyze primary channels only**: Only the primary channels of sensors are analyzed. Be aware of potentially high CPU load of PRTG when choosing this setting for more than 1,000 sensors.
- **Analyze all channels (higher CPU load)**: Similarity detection is applied to all channels. Be aware of potentially high CPU load of PRTG when choosing this setting for more than 500 sensors.

SIMILAR SENSORS DETECTION

- **Turn analysis off**: No similarity detection takes place. Choose this option if you are not interested in the analysis results or you want to keep the CPU load of PRTG at a minimum.

RECOMMENDED SENSORS DETECTION

With the sensor recommendation engine, PRTG can analyze devices in your network and suggest sensors that are still missing for a complete monitoring. The analysis runs with low priority in the background when you add a new device, when the last analysis was executed more than 30 days ago, or when you manually start 185 it.

See the manual section **Recommended Sensors** 184 for more information, for example, on SNMP settings 185, on the results 185 you get and on how you add the suggested sensors 186.

This option is not available in PRTG on demand.

Detection Engine

Define if you want PRTG to analyze your devices to recommend useful sensor types. Choose between:

- **Manage automatically based on sensor count (recommended)**: PRTG runs the detection engine for installations with up to 5,000 sensors by default. If you exceed this threshold, PRTG disables the detection engine for performance reasons. We recommend that you set this option so you do not miss any important monitoring data about your network, without risking to run into performance issues.
- **Always show recommendations**: PRTG always analyzes your devices even if your installation exceeds 5,000 sensors and you will never miss any suggestion to complete your monitoring. But if you enable this option, please keep in mind this setting in case you encounter performance issues.
- **Turn recommendations off**: PRTG never recommends sensors. Select this option if you have performance issues with PRTG or if you do not want to see this information on device overview tabs 166. Moreover, you will not find the option **Recommend Now** in device context menus 222 or on overview tabs anymore.

AUTO-DISCOVERY

Run Discovery at	Define the time when PRTG automatically runs an **Auto-Discovery** [249] in your network if you configured a daily or weekly **Discovery Schedule** in the auto-discovery group settings [251]. Choose a full hour between **0:00** and **23:00**. We recommend that you choose a time when there is little user activity in your network, because auto-discoveries can produce a certain amount of load.

UPTIME THRESHOLD

Desired Minimum Uptime	Define which uptime in percent PRTG regards as 100 percent. This setting affects the colors shown next to the sensor icons in reports. Select one of the predefined values between **90 %** and **99.999 %**.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.12.7 System Administration—Notification Delivery

In the notification delivery settings you can define global settings for notification delivery. If you do not want to use a specific notification method, just leave the respective fields empty.

This option is not available in PRTG on demand.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Note

This section describes one of four steps to set up the notification system in PRTG. A complete notification setup involves:

1. Checking and setting up the **Notification Delivery** settings. This tells PRTG how and where to send messages.
   For detailed information, see **System Administration—Notification Delivery** 2961.
2. Checking and setting up **Notification Contacts** for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** 2934.
3. Checking and setting up **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** 2916.
4. Checking and setting up **Notification Triggers** for objects. This provokes the defined notifications.
   For detailed information, see **Sensor Notifications Settings** 2791.

We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2922 and one SMS notification 2924. If delivery via email fails (due to an email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a state trigger 2793 and a notification via a delivery method other than the one for the first trigger. Or set up a second trigger with another notification for the corresponding object.

For background information, please see the **Notifications** 2829 section.

Notification Delivery Settings

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

SMTP DELIVERY

SMTP Delivery Mechanism	Define how PRTG sends emails using Simple Mail Transfer Protocol (SMTP). Choose between: ▪ **Direct delivery using built-in email relay server (default)**: Use the SMTP relay server built into PRTG. This server manages its own email queue. For each email, it looks up the target SMTP server via the MX record of the target domain, and send the email. ▪ **Use SMTP relay server (recommended inside LANs/NATs)**: Set up your own SMTP relay server to send emails. Enter data below. ▪ **Use two SMTP relay servers (primary and fallback server)**: Set up two own SMTP relay servers—one primary and one as fallback server. Enter data below. ⓘ When monitoring inside your NAT or LAN, it is often a good idea to use your own LAN-based relay server to deliver notification emails quicker.
Sender Email	Enter an email address to use as sender of all emails. This setting is global and can only be changed centrally here.
Sender Name	Enter a name to use as sender of all emails. This setting is global and can only be changed centrally here.
HELO Ident	Enter the HELO Ident for SMTP. This must be a unique name, preferably the DNS name of the machine running PRTG. See SMTP RFC 2821: The sender-SMTP must ensure that the domain parameter in a HELO command is a valid principal host domain name for the client host.
SMTP Relay Server	This field is only visible if you enable SMTP relay server above. Enter the IP address or DNS name of the SMTP relay server.
SMTP Relay SMTP Port	This field is only visible if you enable SMTP relay server above. Enter the port number the SMTP relay server is running on. Standard value is **25**.
SMTP Relay Authentication	This field is only visible if you enable SMTP relay server above. Select the kind of authentication required for the SMTP server. Choose between: ▪ **No authentication is required**: Use SMTP without authentication. ▪ **Use standard SMTP authentication**: Use standard authentication.

SMTP DELIVERY

	▪ **SASL authentication is required**: Use secure authentication via Simple Authentication and Security Layer (SASL).
SMTP Relay User	This field is only visible if you enable SMTP authentication above. Enter a valid username.
SMTP Relay Password	This field is only visible if you enable SMTP authentication above. Enter a valid password.
Use Encrypted Connection	This field is only visible if you enable SMTP relay server above. Enter the security level for SMTP connections. Choose between: ▪ **Never:** Use insecure connection with plain text transfer. ▪ **If supported by server:** Use a secure connection (default).
SSL Method	This setting is only visible if you enable SMTP relay server and encryption above. It is only relevant for secure connections. Select the SSL or TLS version that your SMTP device supports. We recommend that you use the default value. If you do not get a connection, try with another setting. Choose between: ▪ **SSL V2** ▪ **SSL V2 or V3** ▪ **SSL V3** ▪ **TLS V1**
SMTP Relay Server (Fallback)	
SMTP Relay SMTP Port (Fallback)	
SMTP Relay Authentication (Fallback)	These fields are only visible if you enable the option for two SMTP relay servers above. Please see also the settings that you made for your primary SMTP relay server.
Use Encrypted Connection (Fallback)	
SSL Method (Fallback)	
SMTP Relay User (Fallback)	

SMTP DELIVERY

SSL Method (Fallback)

SMTP Relay User (Fallback)

SMTP Relay Password (Fallback)

Security (Fallback)

SMS DELIVERY

Although PRTG has built-in support for the Application Programming Interface (API) of some SMS providers, we cannot officially provide support regarding these SMS service providers. If you have technical questions about SMS delivery beyond PRTG, please contact your SMS provider directly.

Instead of using a pre-configured provider you can always use a custom URL, enabling you to use extended parameters (this is also an alternative when using providers for which we offer pre-configured options).

You need an internet connection to send text messages via the HTTP API.

For information about sending SMS via separate hardware using third party software, please see this Knowledge Base article: How can I send SMS text message notifications via a modem or a mobile phone with PRTG?

Configuration Mode	Define how you want to select an SMS provider. Choose between: ▪ **Select an SMS provider from a list of providers**: Select a provider from a list below. ▪ **Enter a custom URL for a provider not listed**: Use another provider and enter the service URL manually below.
Service Provider	This field is only visible if you choose the provider list above. Select a service provider from the list. PRTG offers a small incomplete list of providers. Some providers might require a port configuration in your firewall. For details, please see this Knowledge Base article: Which URLs does PRTG use for its preconfigured SMS providers?
User	This field is only visible if you choose the provider list above. Enter a username for the service provider account.

SMS DELIVERY

Password	This field is only visible if you choose the provider list above. Enter a password for the service provider account.
API ID / Account	This field is only visible if you choose the provider list above. Some providers need an additional API ID or account information. If provided, enter it here. Please enter a string or leave the field empty.
Custom URL	This field is only visible if you enable the custom provider option above. From the documentation of your SMS provider, please enter the service URL that is used to send SMS messages. Use the following placeholders for the recipient phone number and the text message: ▪ **%SMSNUMBER** ▪ **%SMSTEXT** Please use the GET method to request the custom URL. POST requests are not supported.
Custom URL-SNI	Select if PRTG will send the SNI extension to the TLS protocol along with the HTTP request. Choose between: ▪ **Do not send SNI (default)**: PRTG will not send an SNI when executing the HTTP action. ▪ **Send SNI**: PRTG will send an SNI when calling the target URL. Specify the SNI below.
Virtual Host (SNI)	This field is only visible if you select the SNI option above. Enter the SNI name that your endpoint configuration requires. Usually, this is the Fully Qualified Domain Name (FQDN) of the virtual host.
Encoding for SMS	Define the encoding of the URL string that PRTG sends to your provider. Choose between: ▪ **ANSI local system codepage (default)** ▪ **UTF-8** ▪ **UTF-16**
Maximum Length of Text	Some SMS providers will not allow SMS messages exceeding a certain amount of characters. PRTG will restrict the number of characters according to the length specified in this field. A value of **0** means the SMS is sent at its full length.

The notification 2916 methods **Send SMS/Pager Message** and **Execute HTTP Action** will use the central proxy settings defined for your PRTG core server. For details, please see System Administration—Core & Probes 2967 (section **Proxy Configuration**).

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.12.8 System Administration—Core & Probes

In the core and probe management settings you can define settings for the core server, as well as the settings for probe connections if you use remote or mini probes.

If you cannot save changes to **Core & Probes** settings because you get an **Error (Bad Request)** with the message Active Directory Domain not accessible, ensure you provide the correct access type for your domain in section Active Directory Integration 2971! For example, change from "local user" to **Use explicit credentials** and provide correct credentials for the domain. Please note that PRTG automatically sets the access type "local system" by default, so you might need to change this.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Core and Probes Settings

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

PROXY CONFIGURATION

This option is not available in PRTG on demand.

Use Proxy Server	We recommend that you use PRTG with a direct internet connection. However, if you need to use a proxy, you can configure the relevant settings here. Choose between: ▪ **No, use direct connection to the Internet (default)**: Do not use a proxy. Use this setting if there is a direct internet connection available to the server running the PRTG core server. ▪ **Yes, in our network a proxy is mandatory**: Define proxy settings below. Proxy settings are valid for Auto-Update 3005, Activate the Product 91, obtaining Geo Maps 2824 tiles, and for sending out HTTP, push, and SMS text message Notifications 2921. The sensor types Cloud HTTP 571 and Cloud Ping 580 use these proxy settings as well.

PROXY CONFIGURATION

Proxy Server	This setting is only visible if proxy usage is enabled above. Enter the address of the proxy server that you use for outbound connections. Please enter a valid address.
Port	This setting is only visible if proxy usage is enabled above. Enter the port number of the proxy server that you use for outbound connections. Please enter an integer value.
Use Proxy Credentials	This setting is only visible if proxy usage is enabled above. Determine whether the proxy server needs credentials or not. Choose between: ▪ **Yes, the proxy server requires credentials**: Define credentials (username and password) below. ▪ **No, there are no credentials necessary**: Do not use credentials for proxy connections.
User	This setting is only visible if proxy credentials are enabled above. Enter a username for proxy authentication. Please enter a string.
Password	This setting is only visible if proxy credentials are enabled above. Enter a password for proxy authentication. Please enter a string.

PROBE CONNECTION SETTINGS

Probe Connections IPs	Define how PRTG handles incoming connections from probes. Choose between the following options: ▪ **Local Probe only, 127.0.0.1 (PRTG will not be accessible for Remote Probes)**: The PRTG core server 112 only accepts local probe connections. You cannot use remote probes 3195 with this setting enabled. This is the default setting in PRTG on premises. ▪ **All IPs available on this computer**: The PRTG server will always accept incoming connections from remote probes, no matter on which IP address of the core server they come in. This is the default setting in PRTG on demand. ▪ **Specify IPs**: The PRTG server will accept Incoming connections from remote probes 3206 only on the selected IP address(es) of the core server. In the list, select the IP addresses by adding a check mark in front of the desired IPs.

PROBE CONNECTION SETTINGS

You can also change this setting in the **PRTG Administration Tool on Core Server System** [3139].

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the **Enterprise Console** [3028], or of **PRTG Apps for Mobile Network Monitoring** [3082] will be disconnected and reconnected.

This option is not available in PRTG on demand.

Access Keys

Enter a list of access keys, one per line. Every (remote) probe that wants to connect to this PRTG installation has to use one of these keys. For more information on how to set this key for a probe, please see the **PRTG Administration Tool** [3158] section.

Allow IPs

Enter a list of remote probe IPs or DNS names that will be accepted when connecting to this PRTG installation. Provide one IP address or DNS name per line. The local probe (127.0.0.1) is always allowed automatically. PRTG will check the list of allowed addresses first before the list of denied addresses.

- ***[Empty]***: An empty field does not allow any remote probes (but only the local probe). Please enter IP addresses or DNS names to allow remote probe connections.
  We recommend that you use IP addresses rather than DNS names, because DNS name resolution may be cached.
- **any**: Enter the word **any** to automatically allow all remote probe connections. This is the default setting in PRTG on demand.
  We recommend that you only use this option in intranets in PRTG on premises!

If the IP address of your remote probe changes regularly (for example, due to an internet provider assigning IP addresses dynamically), please enter the potential IP range for this remote probe or use the **any** option.

You can use the PRTG syntax for IP address ranges here. For more information, please see the **Define IP Ranges** [3182] section.

PROBE CONNECTION SETTINGS

Deny IPs

Enter a list of remote probe IPs or DNS names that will not be accepted when connecting to this PRTG installation. Provide one IP address or DNS name per line. This is useful to explicitly deny connections from certain remote probes you do not want to include in your setup any more (for example, for a certain time).

Access to IP addresses or DNS names you allowed above will be denied if you enter them here. This is useful to allow access to an IP range in the field above, but deny access to a single IP address. You can use the PRTG syntax for IP address ranges here (see the **Define IP Ranges** 3182 section).

We recommend that you use IP addresses rather than DNS names, because DNS name resolution may be cached.

Deny GIDs

Enter a list of GIDs, one global ID (GID) per line. The access to matching GIDs will be denied. If you remove a remote probe from the device tree or if you deny a remote probe after installation, its global ID (GID) will be automatically entered here. This specific remote probe will not be able to connect anymore. Denying GIDs is more precise than denying IPs, where other remote probes at the same location could be excluded too.

Mini Probes

Define if you want to allow Mini Probe connections to your PRTG server. If you want to use Mini Probes, you need to set up your PRTG web server to accept connections of Mini Probes here and choose the secure HTTPS server option in the web server settings 2946. Choose between:

- **No Mini Probes**: Mini Probes cannot connect to your PRTG web server. You are not able to monitor with Mini Probes if you choose this option.
- **Allow Mini Probes to connect to the web server**: Mini Probes can connect to your PRTG web server and use the defined TCP port for the web server 2946 for this purpose. The default port for SSL connections is **443**.
- **Allow Mini Probes to connect to an extra port**: Mini Probes can connect via a specific port to your PRTG web server. This is useful if you do not want to have your whole PRTG web server reachable from other networks all the time only because of Mini Probes.
  SSL is always required to be active on the Mini Probe port.

Please refer to the PRTG API 3174 for the full Mini Probe documentation. See also this Knowledge Base article: Where can I find PRTG Mini Probes which are ready to use?

PROBE CONNECTION SETTINGS

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the Enterprise Console 3028, or of PRTG Apps for Mobile Network Monitoring 3082 will be disconnected and reconnected.

This option is not available in PRTG on demand.

Mini Probe Port

This field is only visible if you select the extra Mini Probe port option above. Enter the number of the port that you want to use for Mini Probe connections. Ensure that SSL is available on this port.

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the Enterprise Console 3028, or of PRTG Apps for Mobile Network Monitoring 3082 will be disconnected and reconnected.

This option is not available in PRTG on demand.

ACTIVE DIRECTORY INTEGRATION

This option is not available in PRTG on demand.

Domain Name

To use the Active Directory Integration 3171 enter the name of your local domain. Please enter a string or leave the field empty.

Access Type

Define which user account PRTG will use to configure Active Directory (AD) access. PRTG uses this account to query the AD for existing groups. Choose between:

ACTIVE DIRECTORY INTEGRATION

- **Use the PRTG core service account (usually LOCAL SYSTEM)**: Use the same Windows user account configured for the "PRTG Core Server Service". In a default installation, this is the "local system" Windows user account. If this account does not have the right to query all groups of your Active Directory, do not use this option.
- **Use explicit credentials:** Define a user account that PRTG will use to authenticate against the Active Directory. This should be a user account with full access to all of your Active Directory groups.

Access User	This field is only visible if you enable the use of explicit credentials above. Enter the Windows user account name that PRTG will use to authenticate for Active Directory configuration.
Access Password	This field is only visible if you enable the use of explicit credentials above. Enter the password for the Windows user account that PRTG will use to authenticate for Active Directory configuration.

HISTORIC DATA PURGING: DEFINE FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Data purging enables you to automatically delete unnecessary data to free up disk space and improve system performance. You can define different time spans for several kinds of data. Select here for how many days historic data remains accessible.

For further information on storage locations, please see the **Data Storage** 3226 section.

This option is not available in PRTG on demand.

PRTG on demand purges historic data using the default purging limits of PRTG on premises (see the table below). You cannot modify historic data purging limits in PRTG on demand.

Logfile Records	Define how long records in the system logfile Log Database.db will be kept. Enter a value in days. All entries older than this value will be deleted from the logfile automatically. This also affects the content of the **Logs** 198 tab of monitoring objects like sensors. Keep this value as low as possible to enhance system performance. Default value is **30** days.

HISTORIC DATA PURGING: DEFINE FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Web Server Log Records	PRTG creates one web server logfile every day. Define how many web server logfiles are kept. Enter a value in days. All web server logfiles older than this value will be deleted automatically. Default value is **30** days.
Historic Sensor Data	Define for how many days historic sensor data are kept for all sensors. It is used to create reports 2862 of monitoring data. Enter a value in days. Depending on the used intervals and the number of sensors in your setup, the file containing this data can become large. For smaller installations (500 sensors or less) a value of 365 is usually fine. Historic sensor data is the basis for reports on monitoring data. If you decrease this value, there will be less historic monitoring data available! Default value is **365** days.
Toplist Records	Define how long toplist records for Flow 3099 and Packet Sniffer 3097 sensors are kept. Enter a value in days. We recommend using 30 days here. Old toplist data will be purged automatically as soon as a limit of 2 GB is reached. The oldest data is deleted first from the database. Default value is **30** days.
Closed Tickets	Define how long tickets that are in status closed are kept. Enter a value in days. Default value is **365** days.
Reports	Reports generated in PDF format are stored on disk for later reference. Define the maximum age for these reports. Enter a value in days. All reports older than this value are deleted automatically. Default value is **365** days.
Configuration Auto-Backups	PRTG creates one backup of your configuration every day. Define the maximum age for these backups. Enter a value in days. All configuration backup files older than this value will be deleted automatically.

HISTORIC DATA PURGING: DEFINE FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Default value is **365** days.

Full HTTP Sensor Screenshots	Define how long the screenshots of the **HTTP Full Web Page Sensor** 918 (PhantomJS browser engine) are kept. Enter a value in days. PRTG will delete older screenshots with every sensor scan.

Default value is **10** days.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Remote Probe Setup

Find more information about setting up remote probes in the **Multiple Probes and Remote Probes** 3195 section.

More

- **Define IP Ranges** 3182

Knowledge Base: Where can I find PRTG Mini Probes which are ready to use?

- https://kb.paessler.com/en/topic/61215

8.12.9 System Administration—User Accounts

PRTG administrator users can change all user account settings and add new users.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

User Accounts Overview

The **User Accounts** tab shows a list of all user accounts which exist on this PRTG server. The **Users** table shows various information about each user at a glance.

- **Object**: the name of the user account. Click it to open the **User Account Settings** 2976.
- **Type**: the account type, for example, PRTG Administrator user or Read Only User
- **Email**: the Primary Email Address of this user account
- **Primary Group**: the Primary Group of this user account. Click it to open this user group's settings 2983.
- **Group Memberships**: all user groups that contain this user account
- **Active/Paused**: the status of this user account

See also section **Working with Table Lists** 207 for more information.

You have several options to manage user accounts and groups on this page:

- To change a user's settings, select it from the list by clicking the username. The available setting options are the same as shown in the **My Account** 2909 settings of the currently logged in user (plus some account control options).
- To add a new user to PRTG on premises, click the **New User** button. The options are the same as for existing users (with slight differences).
- To add a new user to PRTG on demand, click the **Invite User** button. The options are almost the same as for existing users, but the initial login password will be generated automatically. The new user can change it later. Click **Send Invite** to save your settings and to send the invitation per email to the defined **Primary Email Address**.
- To batch-add several users at once in a simple way, please click the **Multiple New Users** button. In the dialog box that appears, select an existing user group 2982 from the dropdown menu and enter or paste a list of email addresses. They can be separated by a space, comma, semicolon, or a new line. Click the **Add** button to confirm. For each address, PRTG will create a new local user account within the selected user group, carrying the email address as value for **Login Name**, **Username**, and **Email Address**. A new password will be generated automatically and sent to the email address.
- To add a new user group, click the **New User Group** button. The options are the same as for existing groups (with slight differences).

- Access rights in PRTG are given via user groups. Please make sure a user account is member of the correct user group 2982 and give access to this group in your device tree object's settings 188.

Predefined objects cannot be deleted!

User Accounts Settings

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

USER ACCOUNT

Login Name	Enter the login name for the user. This option is not available in PRTG on demand.
Display Name	Enter a name that the user recognizes. It will not be used for login purposes.
Primary Email Address	Enter the user's email address. Please use an email client that can show HTML emails, otherwise you cannot read emails from PRTG.
Password	Define the user password. For security reasons, the account settings page does not contain the password. Choose between: ▪ **Don't change** ▪ **Specify new password** If you choose to specify a new password, enter the old password and then the new password twice. The new password must be at least 8 characters long. It must contain a number and a capital letter. Leading and trailing whitespaces will be cut. The password of a PRTG Administrator user can only be changed by the same PRTG Administrator user. This option is not available in PRTG on demand.
Passhash	Click **Show passhash** to display the passhash for the selected user. You need the passhash of a user if you use the PRTG Application Programming Interface (API) 3174. This setting is shown for your information only and cannot be changed here.

USER ACCOUNT

This option is not available in PRTG on demand.

API ACCESS

These settings are only available in PRTG on demand.

API Username	Shows the username of the current user account. You need a username if you use the PRTG Application Programming Interface (API). This setting is shown for your information only and cannot be changed here.
API Passhash	Click **Show passhash** to display the passhash for the selected user. You need the passhash of a user if you use the PRTG Application Programming Interface (API). This setting is shown for your information only and cannot be changed here.
Reset API Passhash	Click **Generate new passhash** to reset the passhash of the current user.

ACCOUNT CONTROL

Account Type	This setting is only visible to administrator users. However, it will not show if the user who's account you want to modify is a member of a group with administrative rights. Define the account type for the current user. Choose between: ▪ **Read/Write User**: You can change settings. ▪ **Read Only User**: You cannot edit any settings except your own password. This is a good choice for public or semi-public logins. This setting cannot be changed for the default administrator user.

ACCOUNT CONTROL

Allow Acknowledge Alarms	This setting is only visible if **Read Only User** is enabled above. Acknowledging an alarm is an action that requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may acknowledge alarms 191. Choose between: ▪ **Allow**: Allow acknowledging alarms for this user. ▪ **Deny**: The user will not be able to acknowledge alarms.
Password Changes	Decide if you want the user to be able to change their account's password or not. If you allow the user to change the password, this option will be available in the **My Account** 2909 settings of the respective user. Choose between: ▪ **User may change his account's password** ▪ **Deny the right to change the password** (default) ⓘ This field is only visible if you edit this option for read-only users as an administrator.
Primary Group	This setting is available only for administrator users. Select the primary group for the current user. Every user has to be member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience there is no difference between the primary and other user groups. ⓘ You cannot change the primary group of Active Directory users. Users that you added with **Active Directory Integration** 3171 can only have this AD group as their primary group. If you need to change this, please delete this user account and add it again.
Status	This setting is only shown for administrator users. Define the status of the current user. Choose between: ▪ **Active**: The current user can login to the account. ▪ **Inactive**: The current user's login is disabled. Use this option to temporarily deny access for this user. ⓘ This setting cannot be changed for the default administrator user.
Last Login	Shows the time stamp of the user's last login. This setting is shown for your information only and cannot be changed here.

USER GROUPS

Member of	Shows the groups the current user is member of. Access rights to the device tree are defined on group level. This setting is shown for your information only and cannot be changed here.

AUTO REFRESH AND ALERTING

Auto Refresh	Define if you want PRTG to reload web pages automatically for the current user. Choose between: ▪ **Refresh pages (recommended)**: Automatically refresh the single page elements on the web pages in PRTG. ▪ **No automatic refresh**: Do not automatically refresh web pages.
Auto Refresh Interval (Sec.)	This setting is only relevant if you enable auto refresh above. Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use **30** seconds or more. Minimum value is 20 seconds. Shorter intervals create more CPU load on the server running PRTG. If you experience load problems while using the web interface (or PRTG maps 2885), please set a higher interval.
Play Audible Alarms	Define when PRTG will play an audible alarm the current user on web pages whenever there are new alarms 190. Choose between: ▪ **Never**: Do not play sound files on any web pages. ▪ **On dashboard pages only**: When there are new alarms, play a predefined sound on dashboard 231 pages only. The sound will be played with every refresh of the dashboard page if there is at least one new alarm. ▪ **On all pages**: When there are new alarms, play a predefined sound on all web pages. The sound will be played with every page refresh if there is at least one new alarm. Audible alarms are only played if the **New Alarms** value in the **Global Header Area** 153 of the PRTG web interface is greater than 0 after a page refresh. The number of existing alarms is not considered. For more information about audible notifications and supported browsers, see this Knowledge Base article: Which audible notifications are available in PRTG? Can I change the default sound?

WEB INTERFACE

Homepage URL	Define the user's default page, which is loaded after logging in or clicking on the Home 231 button in the main menu.
Max. Groups/Devices per Group	To provide a fast and smooth user experience, PRTG attempts to reduce page size when displaying the device tree. It automatically collapses groups and devices when reaching a specified number of items. Enter this threshold for groups and devices here. We recommend values between **10** and **30**.
Max. Sensors per Device	In order to provide a fast and smooth user experience, PRTG attempts to reduce page size when displaying the device tree. It automatically collapses groups and devices when reaching a specified number of items. Enter this threshold for sensors per devices here. We recommend values between **10** and **30**.
Timezone	Define the time zone for the current user. Depending on the time zone you select here, PRTG shows the current user's local time zone in all data tables and graph legends. PRTG receives the UTC (Coordinated Universal Time) from the system time set on the PRTG core server for this purpose.
Date Format	Define the date format for the current user. This setting will take effect after the next login.

TICKET SYSTEM

Email Notifications	Define if you want to get emails from the ticket system. Choose between: ▪ **I want to receive an email whenever a ticket changes**: You will receive an email each time a ticket is assigned to you or your user group, or if a ticket that is assigned to you or your user group is changed. If you edit tickets that are assigned to you or your user group, or you assign a ticket to yourself or your user group, you will not get an email. ▪ **I do not want to receive any emails from the ticket system**: You will not get any emails about tickets.

Notification Contacts

In the **Notification Contacts** 2934 tab you can define recipients for each user account. Recipients can be email addresses, phone numbers, or push devices (iOS, Android and Windows Phone devices with the corresponding PRTG smartphone app 3082).

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

More

Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- https://kb.paessler.com/en/topic/26303

8.12.10 System Administration—User Groups

The PRTG administrator users can change existing user groups or add new ones, and define the users that are member of a certain group.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

All the security settings as well as further rights management are conducted via the user groups. This means that group membership controls what a user may do and which objects the user will see when logged in. The actual rights for each object can be defined in an object's settings. There, you can define different rights for each user group.

The **User Groups** table shows you all existing user groups with various information at a glance. You can see all **Members** of a group as well as all user accounts that have this group as **Primary Group** or as **Active Directory Group**.

- To change a user group's settings, select it from the list by clicking on the group name.
- To add a new user to PRTG on premises, click the **New User** button. The options are the same as for existing users (with slight differences).
- To add a new user to PRTG on demand, click the **Invite User** button. The options are almost the same as for existing users, but the initial login password will be generated automatically. The new user can change it later. Click **Send Invite** to save your settings and to send the invitation per email to the defined **Primary Email Address**.
- To batch-add several users at once in a simple way, please click the **Multiple New Users** button. In the dialog box that appears, select an existing user group 2982 from the dropdown menu and enter or paste a list of email addresses. They can be separated by a space, comma, semicolon, or a new line. Click the **Add** button to confirm. For each address, PRTG will create a new local user account within the selected user group, carrying the email address as value for **Login Name**, **Username**, and **Email Address**. A new password will be generated automatically and sent to the email address.
- To add a new user group, click the **New User Group** button. The options are the same as for existing groups (with slight differences).
- For each user group you create, PRTG automatically adds a new device group 119 with the name [group_name] home to the device tree.
- For each user group you create, PRTG automatically adds a new email notification 2922 to notifications 2829 with read access rights 129 for this user group. It has the name Email to all members of group [group_name].
- By default, there are no access rights 129 on existing objects for a newly created PRTG user group. Initially, users in this group will not see any objects in the PRTG device tree except the automatically created home group (with write access rights). Please edit the object settings 188 in your device tree and set access rights for your newly created user group in the **Inherit Access Rights** section.
  The easiest way is to set these rights in the **Root Group Settings** 294.

The multi-edit option is not available for the standard user groups PRTG Administrators and PRTG Users Group.

Predefined objects cannot be deleted!

If you want to delete an Active Directory group, you have to delete all users that are in this group in PRTG first. This is because users that you add with **Active Directory Integration** 3171 always have this group as their primary group.

User Groups Settings

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

USER GROUP SETTINGS

User Group Name	Enter a name for the user group.
Administrative Rights	Define if the members of this group will be PRTG administrators. If you enable this option, all members of this group will have full access to all monitoring objects, maps, reports, user accounts and user groups, and they can change the PRTG monitoring configuration. Choose between: ▪ **Yes**: Give full PRTG administrator rights to all members of this group. ▪ **No**: Do not make members of this group administrators. Access to monitoring objects for users that are member of this group will be controlled by the **Access Rights** settings defined in the **Object Settings** 188 of Probes, Groups, Devices, or Sensors. This option is especially useful in combination with the Active Directory option below.
Default Homepage	Enter a PRTG internal web page. This will set the default homepage for all new users created with this group. A user will be redirected to this page after logging in. This concerns new users either added by an **Active Directory** login or by the **Add multiple users** feature.
Use Active Directory	Define if this PRTG user group will be connected to a group in your active directory. Choose between:

USER GROUP SETTINGS

	▪ **Yes**: Connect this group to an AD group. Choose below. For detailed information, please see Active Directory Integration 3171. ▪ **No**: Do not use Active Directory integration for this group, but choose local user accounts instead. This option is not available in PRTG on demand.
Active Directory Group	If a valid Active Directory Domain is set in the System Administration—Core & Probes 2971 settings and Active Directory integration is enabled above, a drop down menu will appear, showing the groups in your Active Directory. Choose the group whose members will be able to log in to PRTG using their Active Directory domain credentials. All of those AD users will be in the security context of the PRTG group you're about to create/edit. For detailed information, please see Active Directory Integration 3171. If your Active Directory contains more than 1000 entries in total, PRTG will display an input field instead of a drop down menu. This is done due to performance reasons. In the input field, you can enter the group name only. PRTG will then add the prefix automatically. This option is not available in PRTG on demand.
New User Type	If Active Directory integration is enabled above, define the default rights for all new users in this user group. If a user logs in for the first time using Active Directory credentials, PRTG will automatically create a new local user account for this user, applying the user type defined here. Choose between: ▪ **Read/Write User**: The user may change settings. ▪ **Read Only User**: The user may not edit any settings except the own password. This is a good choice for public or semi-public logins.
Allowed Sensors	Define if members of this user group will be able to create all available sensor types or only specific ones. Choose between: ▪ **Users may always create all sensor types**: No restrictions for group members are applied. ▪ **Users may create certain sensor types only**: Choose the allowed sensor types below. This option is especially interesting for a Managed Service Provider (MSP).

USER GROUP SETTINGS

Users May Create These Sensor Types	This field is only visible if you defined that the users in this group are only allowed to create certain sensor types. A list of all available types is shown with their name. Select the desired types by adding check marks in front of the respective lines. You can also select and deselect all items by using the check box in the table head.
Ticket System Access	Define if the members of this user group will be able to use the PRTG ticket system 200. Choose between: ▪ **Members can use the Ticket System**: No restrictions for group members are applied. ▪ **Members can NOT use the Ticket System**: The **Tickets** 242 option in the main menu bar 242 will not be visible to users in this group.

MEMBERS

Members	This setting is available only if Active Directory integration is disabled above. Define which local user accounts will be a member of this group. To add a user account from the list, add a check mark in front of the username. The user accounts available depend on your setup.

PRIMARY USERS

User List	Shows a list of all user accounts with this group set as primary group. This is shown for information purposes only. You can change it in a user account's settings 2975.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

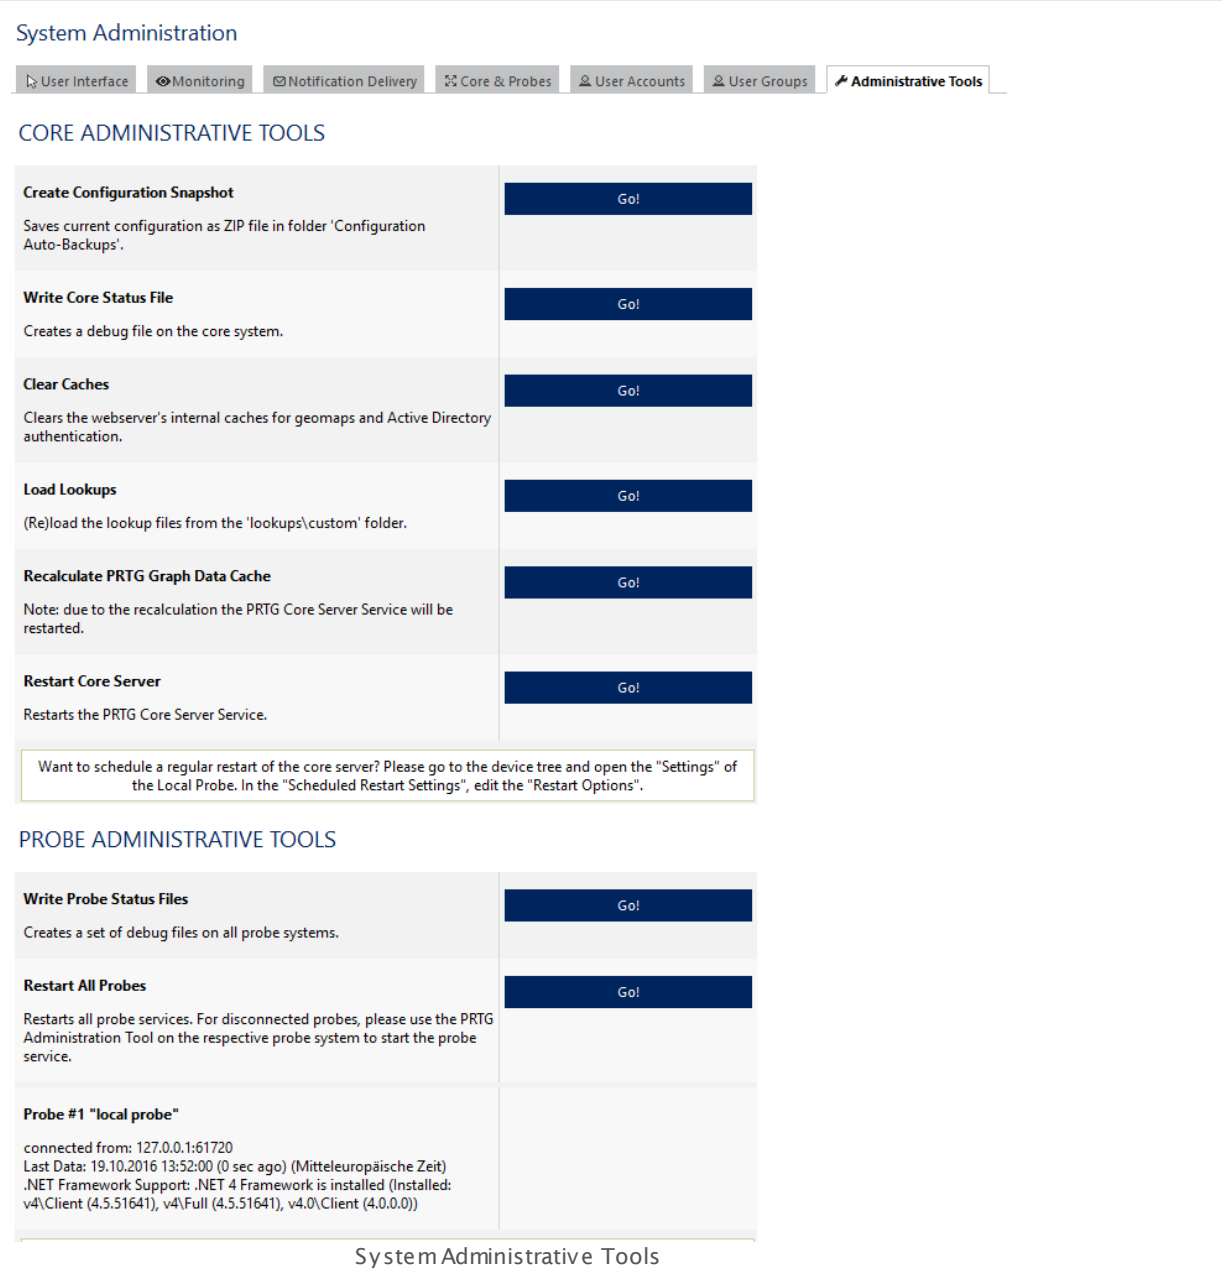
In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who made the change, and a message. The history log retains the last 100 entries.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

8.12.11 System Administration—Administrative Tools

With the administrative tools you can start system specific processes for debugging purposes. Use them if our technical support advises you to do so. You can start the respective processes by clicking the **Go!** button on the right.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.



System Administrative Tools

Core Administrative Tools

CORE ADMINISTRATIVE TOOLS

Create Configuration Snapshot	Create a snapshot of your PRTG configuration. This action can take up to 100 seconds. Once finished, you will find a ZIP file that contains a *.dat file in the **Configuration Auto-Backups** subfolder of your PRTG data directory 3226. If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. The ZIP file follows the name pattern PRTG Configuration (Snapshot YYYY-MM-DD HH-MM-SS).zip. This option is not available in PRTG on demand.
Write Core Status File	Create status files of your PRTG core server. You will find the two text files in the **Logs (System)** sub folder of your PRTG data directory 3226. If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. The files are named Core Status.txt and Core Memory.txt. They are overwritten each time you click this button. This option is not available in PRTG on demand.
Clear Caches	PRTG caches tiles for **Geo Maps** 2824 and user data for **Active Directory Integration** 3171. Use this button to delete the cache if you encounter broken Geo Maps tiles, or if you changed a user's password in the Active Directory. This option is not available in PRTG on demand.
Load Lookups	(Re)load the lookup files 3183 from the **\lookups\custom** folder. In this folder your customized lookup files are stored. If you have created a new lookup file or changed something in an existing lookup file, it might be necessary to load or to reload these files. This option is not available in PRTG on demand.
Recalculate PRTG Graph Data Cache	PRTG constantly writes monitoring data to disk and keeps the graphs for your graph tabs in memory. If PRTG is ended unexpectedly, the graph cache may get corrupted. In this case, graphs may be shown empty or show wrong data. If you experience graph display problems, a graph recalculation will fix the problem. Click **Go!** to delete the data cache file and recalculate it automatically.

CORE ADMINISTRATIVE TOOLS

If you apply recalculation, PRTG needs to restart the core server. Because of this, all users of the PRTG web interface, of the Enterprise Console 3028, or of Smartphone Apps 3082 will be disconnected. After clicking the **Go!** button, a dialog window will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

Directly after this action your graphs will be empty. They will be re-filled successively while recalculation in the background progresses. Until recalculation is finished, performance of the PRTG web interface may be affected due to high disk I/O activity.

Restart Core Server	Restart the PRTG core server service manually. Click the **Go!** button for this purpose. If you restart the core server, all users of the PRTG web interface, of the Enterprise Console 3028, or of Smartphone Apps 3082 will be disconnected. After clicking the **Go!** button, a dialog window will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. If you want to schedule an automatic restart of Windows services for both core server and probe service, you can do this in the corresponding Probe Settings 330. This option is not available in PRTG on demand.

Probe Administrative Tools

PROBE ADMINISTRATIVE TOOLS

Write Probe Status Files	Create status files of your PRTG probes. PRTG writes status files for the local probe running on the PRTG core server (if you run a PRTG cluster, on the cluster node you are currently logged in to) as well as for all remote probes configured (if any). On the respective systems, you will find four text files in the **Logs (System)** sub folder of the PRTG data directories 3226. The files follow the name pattern Probe Memory XX.txt, ProbeState XX.txt, ProbeState AXX.txt, and ProbeState BXX.txt. They are overwritten each time you click this button.

PROBE ADMINISTRATIVE TOOLS

Restart All Probes	Restart all PRTG probes as well as the local probe Windows service. If there are any remote probes 3195 configured, the probe Windows services on the respective remote systems will be restarted as well. To restart single probes only, please see below. Disconnected probes cannot be restarted here. Please use the **PRTG Administration Tool** 3134 on the probe system to start a disconnected probe. If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. In this case, remote probes are only restarted if you are logged in to the primary master node. The cluster probe Windows service of failover nodes is not restarted if you execute this action on the master node. If you want to restart the cluster probe Windows service of a failover node, please log in to this failover node's web interface and click the **Go!** button there.
Probe [#Number] "[Name]"	This section shows information about the connection status. If the probe is currently connected, the field shows the source IP address and port number used by the probe. For the **Local Probe**, the IP will always be 127.0.0.1. You will also see information about the date when the last data packet was received from the probe. If you want to restart a single probe, click the corresponding **Restart Probe** button. Entries for every single probe are following. Disconnected probes cannot be restarted here. Please use the **PRTG Administration Tool** 3134 on the probe system to start a disconnected probe. This option is not available for local probes in PRTG on demand.

Others

There are some settings that you must make in the PRTG Administration Tool 3134, available as native Windows application. For more details, please see the sections:

- PRTG Administration Tool on Core Server System 3135
- PRTG Administration Tool on Remote Probe System 3157

8.12.12 System Administration—Cluster

In the cluster settings you can define the cluster settings. During **Failover Cluster Configuration**[3212], the cluster settings were already pre-defined. See the cluster status[3010] to see if all nodes in your cluster are properly connected.

This feature is not available in PRTG on demand.

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

Cluster Settings

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

You can set up two, three, four, or five nodes in one cluster for PRTG on premises. In the table of the cluster settings, the information of each node is written in one line.

CLUSTER NODE SETUP

Node Name	Enter the name of the node (for display purposes).
Node ID	The ID is unique for every node. We recommend that you use the default value.
Node State	You can set the state for every failover node. Choose between: ▪ **Active**: Set the node to be active. ▪ **Inactive**: Set the node to be not active. It will be disabled in the cluster configuration. It will then be not an active part of the cluster and will not appear in the cluster status[3010] any more. This setting is not available for the master node of a cluster. The master is always set to **Active**.
IPs/DNS Names Used for Connections Between Nodes	Define the IP addresses or DNS names that will be used for the connections between the nodes. You can enter different values for every node-node connection.

CLUSTER NODE SETUP

For example, in the field **#2 => #1**, enter the address under which the master node server can be reached from the second cluster member. Usually, this is the IP address or DNS name of the master node. Do this for all available node connections, for example, if you run three nodes, enter the address under which second node can be reached from the third cluster member into the field **#3 => #2**.

See also section **Failover Cluster Step by Step, Step 4** 3221 and following.

If you use remote probes 3196 outside your local network or outside your Network Address Translation (NAT), ensure the IP addresses or DNS names you enter here are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. These addresses must not be private and have to be reachable from the outside, otherwise your remote probes will not be able to connect.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

For how to set a cluster node into **Maintenance Mode**, see **PRTG Status—Cluster Status** 3010.

The entire setup process for a cluster requires several different steps. For more information and step-by-step guidance, see **Failover Cluster Configuration** 3212.

8.12.13 PRTG Status—System Status

To view the status of your PRTG installation, select **Setup | PRTG Status** from main menu. Click on the tabs to change the different settings.

PRTG Status Tabs

You can view the following aspects of the PRTG status:

- PRTG Status—System Status 2994
- PRTG Status—Cluster Status 3010

System Status

Click on the **System Status** tab to view relevant system information. You might need this data for debugging or when you contact our support team. They ask you in some cases to provide PRTG status information to analyze your issues with PRTG. Furthermore, this page shows interesting usage statistics.

SOFTWARE VERSION AND SERVER INFORMATION

PRTG Version	Shows the exact version of the build your PRTG installation is currently running on.
Auto-Update Status	Shows the latest auto-update message available from Software Auto-Update 3005. For example, the message will indicate any PRTG updates ready to be installed. This information is not displayed in PRTG on demand.
Operating System	Shows the exact Windows version build and service packs, the number and kind of CPUs, and the computer name, of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. When running PRTG on virtual systems, not all of the mentioned values may be available. This information is not displayed in PRTG on demand.

SOFTWARE VERSION AND SERVER INFORMATION

Server Time	Shows the date and time of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Server CPU Load	Shows the current CPU load of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Username	Shows the username 2909 of the PRTG user you're currently logged in as.
Browser	Shows the name and user agent string of the browser you're currently viewing this page with.

LICENSING

License Status	Shows the activation status of this installation of PRTG. Usually, PRTG completes the activation automatically during installation or when you change your license information. Only if PRTG cannot connect directly to the internet, a manual activation is necessary. For details, please see **Activate the Product** 91.
License Name	Shows the owner of the license 89 that you use for this installation of PRTG. License Name, license key, and system ID together build your license information. You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you change your license key 89.
License Key	Shows the license 89 key that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.
System ID	The system ID is a fixed value that is automatically assigned to your PRTG installation.
Licensed Edition	Shows the PRTG edition that you use for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).

LICENSING

Last Update	Shows the date of the last update for this PRTG installation. We recommend that you use the PRTG **Auto-Update** 3005 to get the most out of PRTG.
Maintenance until	Shows the expiry date and the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract you may download any available updates and use our premium email support.
Number of Sensors	Shows the number of sensors you can use in your monitoring with your current edition of PRTG (see above). If you reach the limit, PRTG will set each new sensor that you add to a **Pause** status 163 automatically. To upgrade your license right now, click the **Need more sensors? Click here to upgrade!** button to visit our web shop. Editions that allow an **unlimited** number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit 25 is reached. This means that you can use about 10,000 sensors per core server (depending on your system's performance, sensor types, and scanning intervals). For details, see section **Detailed System Requirements** 25.

SYSTEM STARTUP LOG

Shows the log information created during the last startup of the PRTG core server. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

SYSTEM WARNINGS

If there are any warnings, PRTG will show them here. Usually, you will see "None" system warnings.

CLUSTER STATUS

This box is only visible if you run a PRTG cluster. This section lists all cluster nodes configured in your monitoring.

Node [Number]	Shows the name of the cluster node as well as the node type (primary/secondary node) and status (current master/failover node). Additionally, all connections from this node to the other cluster nodes are shown, as illustrated on the **PRTG Status—Cluster Status** 3010 page.

LOCAL STATUS

This box is only visible if you run a PRTG cluster. This section lists information about the cluster node you're currently logged in to.

Server State Cluster Messages	Shows internal summary information about the current node and the communication between the nodes. You might be asked about this by Paessler's technical support staff.

CLUSTER CONNECTIONS

This box is only visible if you run a PRTG cluster. This section lists information about the connections between the different cluster nodes.

State of Local Node	Shows Treeversion and size of the Server Volume, both internal system information.
State of Cluster Members	For each cluster node, the name and IP address is shown, as well as a state CRC code, the time stamp of the last "keep alive" signal sent, the current size of the buffer, and the remote IP.
Message State of Cluster Members	For each cluster node, the name, IP address, and unique identifier is shown, as well as the connection state, and statistic information about the cluster message system which is used for the communication between the different nodes.

CORE SYSTEM MEMORY

Shows machine-oriented information regarding the memory usage of the core server system. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

See the Knowledge Base for more information: What do the PRTG core system memory parameters mean?

THREAD INFORMATION

Shows machine-oriented information regarding the threads running on the core server system. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

ACTIVITY HISTORY

The "Activity History" shows how busy PRTG was for you in the past. The graphs indicate the number of activities on the last 365 days. Right to the graphs, you see statistics about the past day.

Sensor Scans	Shows how often all sensors 120 in this PRTG installation refreshed their data in the past.
Sensor State Changes	Shows how often the **Sensor States** 163 changed in the past.
Notifications Sent	Shows how many **Notifications** 2829 PRTG sent out in the past.
Reports Generated	Shows how many **Reports** 2862 PRTG created in the past.
Page Views	Shows how often pages in the PRTG web interface were opened in the past.
Sensors	Shows how many sensors 120 existed in this PRTG installation in the past.
Devices	Shows how many devices 120 existed in this PRTG installation in the past.

ACTIVITY HISTORY

Reports	Shows how many **Reports** 2862 existed in this PRTG installation in the past.
Maps	Shows how many **Maps** 2885 existed in this PRTG installation in the past.

AUTO-DISCOVERY TASKS

Currently Running	Shows the number of auto-discovery tasks that are currently running. A high number of auto-discovery tasks can negatively influence system performance.

BACKGROUND TASKS

Historic Data	Shows if PRTG is re-calculating the historic data cache in the background. If so, you will see the tasks to do until done. Usually, this calculation is done after every core server restart.
Toplist Buffer	When using xFlow 3099 or Packet Sniffer 3097 sensors, PRTG stores Toplist data. The data stream received is buffered and written to the data directory of the core system. Depending on the number and size of the data stream as well as the hard disk and system performance of the core system, the buffer size can rise. When reaching a buffer size of 500, Toplist data is dropped which can lead to incorrect Toplist values for the sensors.
Toplist Upgrade	If you recently updated from an older PRTG version (7 or 8), Toplist data needs to run through a one-time conversion process. While conversion is running you may experience a considerably slow monitoring system. Usually, you will see n/a here.
Similar Sensors Analysis	Shows the current status and the selected setting for the analysis depth of the **Similar Sensors** 180 analysis.
Recommended Sensors Detection	Shows the current status of the detection engine and the current tasks of the **Recommended Sensors Detection** 2959.

DATABASE OBJECTS

Shows statistic information about your monitoring configuration. This information might be necessary when contacting Paessler's technical support staff.

Probes	Shows the total number of probes 312 configured.
Groups	Shows the total number of groups 334 in your configuration.
Devices	Shows the total number of devices 360 in your configuration.
Sensors	Shows the total number of sensors 384 in your configuration.
User Groups	Shows the total number of user groups 2982 in your configuration.
Users	Shows the total number of users 2975 configured.
Notifications	Shows the total number of notifications 2916 configured.
Schedules	Shows the total number of schedules 2938 configured.
Maps	Shows the total number of created maps 2885 in your installation.
Libraries	Shows the total number of created libraries 2845 in your installation.
Reports	Shows the total number of reports 2862 in your installation.
Requests/Second	Shows a value calculated from the total number of sensors and the average scanning interval configured. This number indicates how many monitoring requests per second are sent from the probe(s) to the devices in your network. There are no general guidelines what is a "good" value here. This depends on the sensor types used as well as on your system's performance.
Sensors	Shows a list with numbers and types of sensors used in your configuration. In the list, internal short names are used for sensor types instead of the official designations.

SENSORS BY PERFORMANCE IMPACT

Shows all sensor types used in your configuration ordered by performance impact (from very low to very high). If your PRTG system is very slow, you can see which sensors might cause this issue. Please consider the recommended number of sensors in the respective manual sections [384] for sensors with high and very high performance impact.

In the list, internal short names are used for sensor types instead of the official designations.

SENSORS BY INTERVAL

Shows all sensor types used in your configuration ordered by scanning interval. Please choose reasonable scanning intervals for sensors which can affect the system performance. See the respective manual sections [384] for sensors for more information.

In the list, internal short names are used for sensor types instead of the official designations.

PROBES

This section lists all probes configured in your monitoring. If there are no remote probes configured, only the **Local Probe** appears in the list, which always runs on the PRTG core server.

If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. Remote probes (if any) will only be shown when you are logged in to the primary master node. When logged in to a failover node, the cluster probe running on this node will appear as **Local Probe**.

Probe [#Number] "[Name]"	Information about the connection status is shown. If the probe is currently connected, the field shows the source IP address and port number used by the probe. For the **Local Probe**, the IP will always be 127.0.0.1. You will also see information about the date when the last data packet was received from the probe. If you want to restart a single probe, please open the Administrative Tools Settings [2987].

SYSTEM SETTINGS

Web Server URL	Shows the URL to access the PRTG web interface 136. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server IPs	Shows all IP addresses the PRTG web server is running at. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server Ports	Shows the port the PRTG web server is running at. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server Port Usage	Shows the number of ports used by the PRTG web server.
Incoming Probe Connection Binding	Shows a combination of the two values below.
Incoming Probe Connection IPs	Shows a list of all IP addresses on which your current PRTG installation listens to incoming remote probe connections. This is the same information as shown in the **System Administration—Core & Probes** 2967 settings. 0.0.0.0 means that the core server listens on all local network adapter IPs.
Incoming Probe Connection Port	Shows the port number on which your current PRTG installation listens to incoming remote probe connections. The default port is 23560.
Probe Allow IPs	Shows all source IP addresses that will be accepted by the core server for incoming remote probe connections. This is the same information as shown in the **System Administration—Core & Probes** 2967 settings and can be changed there. any means that all remote probe connections are accepted, regardless of the IP address of the remote probe system.
Probe Deny IPs	Shows all source IP addresses that will be denied by the core server for incoming remote probe connections. This is the same information as shown in the **System Administration—Core & Probes** 2967 settings and can be changed there. Denied IPs are superior to allowed IPs. If this field is empty, there are no denied IPs. PRTG automatically adds the IP address of a remote probe system to this list when you delete a remote probe from your device tree 118.

SYSTEM SETTINGS

DataPath — Shows the path where PRTG stores its configuration, monitoring database, etc. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. In order to change this setting, please open the **PRTG Administration Tool** 3135 on the system of the PRTG core server (or of the respective cluster node, if applicable).

WEB SERVER ACTIVITY

Shows statistic information about the web server since last startup. All values are reset when the core server is restarted. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

Time Since Startup	Shows the time that has passed since the PRTG web server was started.
Page Views	Shows the total number of page views on this core server.
Geo Maps	Shows the total number of geo maps shown on this core server.
HTTP Requests	Shows the total number of HTTP requests to this core server.
HTTP Requests > 500/1000/5000 ms	Shows for how many (percent) of the HTTP requests above the page delivery took longer than 500, 1,000, or 5,000 milliseconds.
Slow Request Ratio	Shows a calculated number of the HTTP request values above. The lower this number, the faster is your installation's web interface.

SYNCHRONIZATION

The core server holds the configuration of the entire monitoring and deploys it to the probes. This section shows statistic information about the synchronization of the core server with the local probe and all connected remote probes (if any), since last startup of the core server. All values shown here are reset when the core server is restarted. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

SYNCHRONIZATION

Only when logged in to the primary master node, you will see synchronization data for remote probe connections.

Last Synchronization with a Probe	Shows the time stamp of the last probe synchronization, and if there is still something to do.
Probe/Core Message Count	Shows the total number of messages sent between core and probe(s), as well as a calculated message speed value.
Raw Buffer Count	Shows the number of raw buffers and a corresponding status indicator.
Sync Cycle Speed	Shows the time necessary for a full synchronization, as well as an evaluation comment of this time (usually, this will be "OK").
Configuration Requests Sent	Shows the total number of configuration requests and the requests that still have to be sent.
Configuration Requests Deleted	Internal debug information. Usually, this value will be 0.
Configuration Requests With Response	Internal debug information. Usually, this value will be 0.

Paessler Website: System Requirements for PRTG Network Monitor—Recommended Setup for Most PRTG Users

- https://www.paessler.com/prtg/requirements

Knowledge Base: How can I speed up PRTG—especially for large installations?

- https://kb.paessler.com/en/topic/2733

Knowledge Base: What do the PRTG core system parameters mean?

- https://kb.paessler.com/en/topic/71671

8.12.14 PRTG Status—Auto-Update

Whenever a new version of the software is available from the Paessler website PRTG will download the setup file automatically if a direct internet connection is available. The **PRTG System Administrator** user will then receive a ToDo ticket 201 with instructions to initiate the update installation.

For customers using a Freeware or Trial Edition 21, automatic software updates are available at any time. Customers using a Commercial Edition 21 need to have an active maintenance contract to receive updates.

This option is not available in PRTG on demand.

Status

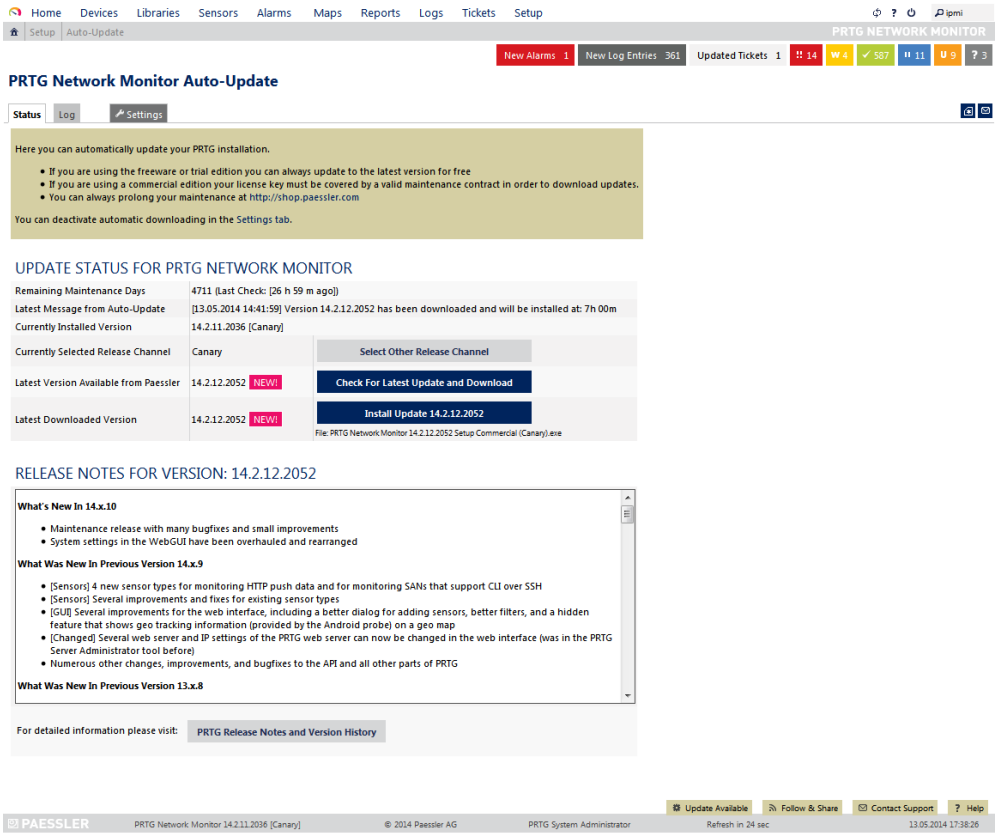
This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

To view the auto-update page of your PRTG installation, select **Setup | Auto-Update** from main menu. On the **Status** tab you can download and perform updates.

Using Auto-Update

If there is a new version available, you will see detailed information about the available version. Please read these notes carefully! You find a summary of current and past release notes below the update section. For detailed release notes, click **PRTG Release Notes and Version History** which will redirect you to the version history page on paessler.com.

To install the latest available version, click **Install Update [version number]**. PRTG will ask you to confirm installation and license—and that's it!



Automatic Software Update Page

Manually Install an Interim Update

Not all available updates from Paessler will be pushed to all customers, but they are still available from the website. Sometimes Paessler support may ask you to update to the latest version.

In this case please click the **Check For Latest Update and Download** button. PRTG will then connect to the Paessler servers and download the setup file, regardless of the status of the update-check. Then **Install Update [version number]**.

To use this function, a direct internet connection is necessary on the computer running the PRTG core server.

Select Other Release Channel

PRTG is available in three different release channels.

For details about continuous rollout and release channels, see the Paessler Blog: [Version 12 of PRTG will introduce "Continuous Rollout"]

To change the release channel you receive updates from, please open the auto-update **Settings** 3007 tab and choose the desired release channel in the **Release Channel** section.

Log

Click the **Log** tab to show log information about the update status of PRTG, newest first. In the table list 207 appearing, you can filter the items by using the respective options 207.

For more information, see the **Logs** 198 section.

Settings

Click the **Settings** tab to configure the PRTG **Software Auto-Update**.

SOFTWARE AUTO-UPDATE

When a New Version is Available	Define what to do when there are software updates available. Choose between: ▪ **Automatically download and install the latest version**: PRTG automatically downloads and installs any new version as soon as PRTG detects that there is a newer version available (PRTG checks this once per day). The installation of a new version will restart the PRTG Windows services and may also include a server restart. ▪ **Automatically download the latest version and alert the admin**: PRTG automatically downloads any new version as soon as PRTG detects that there is a newer version available (PRTG checks this once per day). After successful download, PRTG will create a ToDo ticket 201 for the PRTG System Administrator user. ▪ **Alert the admin only**: When PRTG detects that there is a newer version available, it will not download updates automatically, but create a ToDo ticket 201 only. You can still download updates manually on the **Auto-Update** 3006 page.
Installation Time	If you select the automatic installation option above, choose the desired time for installation of updates from the drop-down menu.
Release Channel	PRTG updates are delivered in different release channels. You can choose between maximum stability, or most early access to new features. Please choose between:

SOFTWARE AUTO-UPDATE

- **Stable: Updated about once per month (most conservative option, recommended)**: These are our best tested versions. Choose this channel for live environments you have to depend on!
- **Preview: Updated about once per week**: Versions in this channel are already thoroughly tested in our labs, but may still contain limitations in certain monitoring configurations. Choose this channel if you are willing to take a little risk for the benefit of getting new features and bug fixes a little earlier. We strongly recommend to not use those versions in live environments you have to depend on!
- **Canary: Updated daily (testing only, should not be used on live systems)**: Updated every night. Use with CAUTION! Software versions in this channel are not tested yet, might contain severe bugs, and are provided for testing purposes only. We strongly recommend to not use those versions in live environments you have to depend on!

For details about continuous rollout and release channels, see the Paessler Blog: Version 12 of PRTG will introduce "Continuous Rollout"

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notes

There are a few things we ask you to consider regarding automatic software updates:

- In order for auto-update to work the machine running the PRTG core server needs direct internet access. If a proxy connection is needed, please configure it in the **System Administration—Core & Probes** 2967 settings.
  For details about the update servers, see this Knowledge Base article: Which servers does PRTG connect to for Software Auto-Update and for Activation?
- During installation the core server may be restarted without notice.
- PRTG updates existing remote probes automatically, causing short downtimes in monitoring of remote locations. In rare cases a manual update of remote probes is required after you update the core server. In these cases you will be notified in the device tree, and monitoring of remote locations will be interrupted until you perform the manual update 93 on the system(s) running the remote probe(s). If a server with a probe uses several network connections with different IP addresses, ensure these addresses are included in the list of allowed IPs 2968. Otherwise the remote probe on this machine might be disconnected after an update.

- In a cluster installation the update needs to be installed on one node only. The new version will then be deployed to all other cluster nodes automatically (causing a short downtime for the monitoring on the cluster nodes, one after another).
- If you run several individual PRTG core servers that are not in a cluster, for example, in combination with the **Enterprise Console** 3028, an update has to be initiated and confirmed for each single core server.
- You can disable automatic downloading on the **Auto-Update Settings** 3007 tab. Updates will then only be downloaded on request, when you click the **Check For Latest Update and Download** button.
- PRTG does not start auto-update downloads if there is less than 500 MB disk space available on the core server system. If this is the case, you can check this on the **Log** 3007 tab.

8.12.15 PRTG Status—Cluster Status

To view the status of your PRTG installation, select **Setup | PRTG Status** from main menu. Click on the tabs to change the different settings.

PRTG Status Tabs

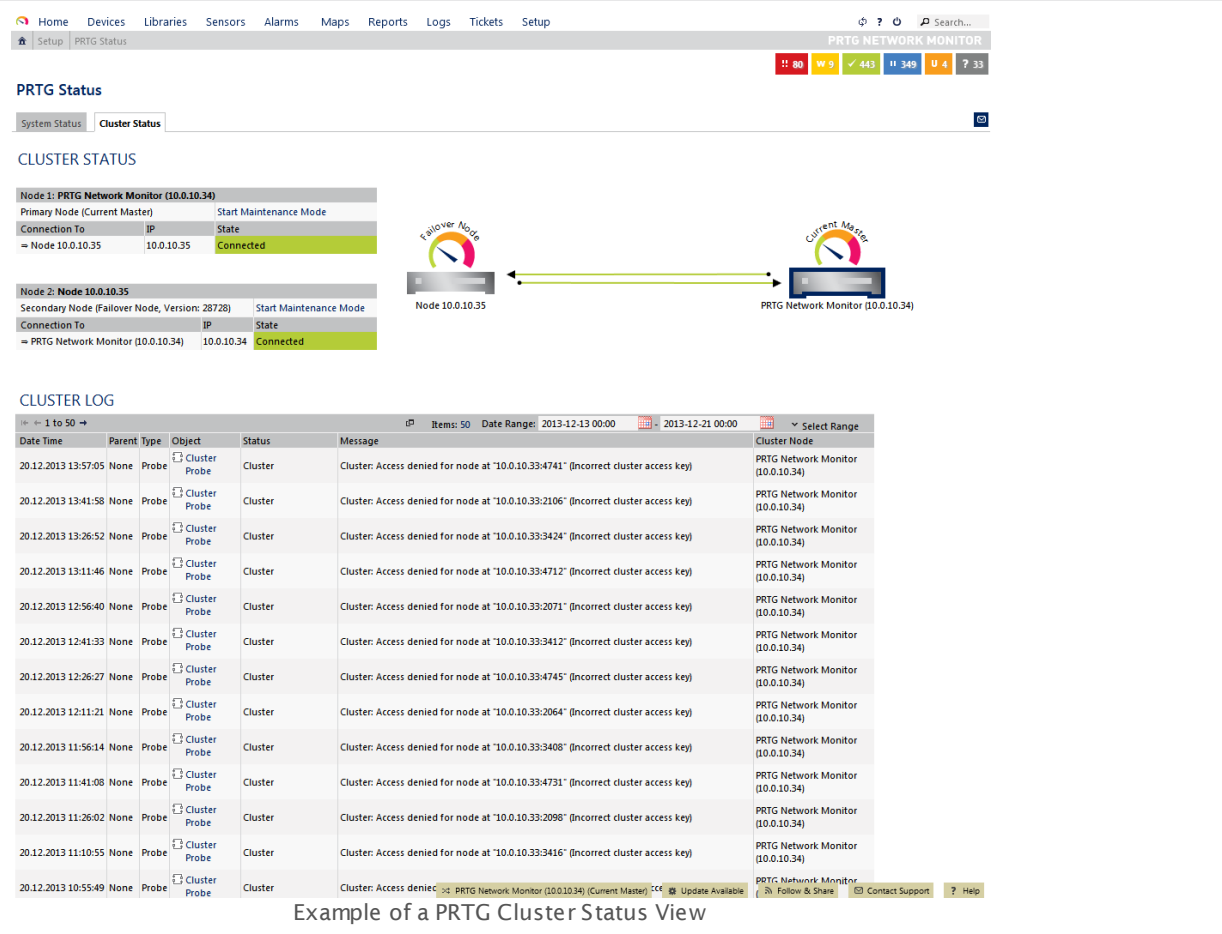
You can view the following aspects of the PRTG status:

- **PRTG Status—System Status** 2994
- **PRTG Status—Cluster Status** 3010

Cluster Status

Click the **Cluster Status** tab to view all nodes connected to the cluster. This tab is only available if you run PRTG in cluster mode 116. The following information is available:

- **Cluster Status** with all connected nodes as table and graphic
- **Cluster Log** with all log entries for cluster connections



Example of a PRTG Cluster Status View

Click the **Start Maintenance Mode** link to put a cluster node in maintenance mode. A node in this mode is still connected to the cluster, but its monitoring results are discarded until you click the **Stop Maintenance Mode** link. You can use this functionality to explicitly exclude a node from monitoring if you know that the monitoring values will not be accurate, for example, because you reconfigure the failover server. During maintenance, a cluster node is displayed with a transparent color in the overview graphic.

On this page, you will not see if your remote probes are connected to failover nodes 3215. Please connect to your failover nodes and check explicitly if remote probes are connected (for example, in the device tree of the PRTG web interface on a cluster node).

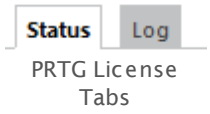
For more information about cluster settings, see section System Administration—Cluster 2992.

This feature is not available in PRTG on demand.

8.12.16 PRTG Status—Licensing Status and Settings

To view information about the license of your PRTG installation and to enter your license key, select **Setup | License** from the main menu.

This option is not available in PRTG on demand.



PRTG License Tabs

You can view the following aspects of your PRTG license:

- **Your License—Status** 3012
- **Your License—Log** 3013
- **Update Your License** 3014

If you use PRTG on premises and open the system administration page from another administration page, PRTG will ask you to enter your credentials again for security reasons if 15 minutes (900 seconds) have passed since your last credential-based login. A dialog box will appear. Enter your **Login Name** and **Password** for PRTG in the corresponding fields and confirm to continue.

This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. If you use other user accounts, interfaces, or nodes, you might not see all of the options in the way described here. If you use a cluster installation, note that failover nodes are read-only by default.

Status

Click the **Status** tab to view information about your license.

LICENSING

License Status	Shows the activation status of this installation of PRTG. Usually, PRTG completes the activation automatically during installation or when you change your license information. Only if PRTG cannot connect directly to the internet, a manual activation is necessary. For details, please see **Activate the Product** 91.
License Name	Shows the owner of the license 89 that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.

LICENSING

	You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you change your license key 89.
License Key	Shows the license 89 key that you use for this installation of PRTG. License Name, license key, and system ID together build your license information.
System ID	The system ID is a fixed value that is automatically assigned to your PRTG installation.
Licensed Edition	Shows the PRTG edition that you use for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).
Last Update	Shows the date of the last update for this PRTG installation. We recommend that you use the PRTG **Auto-Update** 3005 to get the most out of PRTG.
Maintenance until	Shows the expiry date and the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract you may download any available updates and use our premium email support.
Number of Sensors	Shows the number of sensors you can use in your monitoring with your current edition of PRTG (see above). If you reach the limit, PRTG will set each new sensor that you add to a **Pause** status 163 automatically. To upgrade your license right now, click the **Need more sensors? Click here to upgrade!** button to visit our web shop. Editions that allow an **unlimited** number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit 25 is reached. This means that you can use about 10,000 sensors per core server (depending on your system's performance, sensor types, and scanning intervals). For details, see section **Detailed System Requirements** 25.

Log

Click the **Log** tab to show a table list 207 of all system log entries with all messages and status changes regarding your license.

Change and Update License Information

Use the buttons to edit your license or refresh your maintenance information.

- **Change License Key**: If you want to use another license for this PRTG installation, for example, after an license upgrade, click this button to change your license information. See below 3014 for more details.
- **Refresh Information**: If you have renewed your maintenance and the licensing information above does not show the new maintenance period yet, click this button to manually refresh your maintenance information. An automatic refresh of the maintenance information may take several days. See below 3014 for more details.
- **Deactivate this License**: If you want to use the license of the current PRTG installation on another computer, click this button to deactivate the license. This is necessary, for example, when you move PRTG to another computer, because a PRTG license can be active on only one computer at the same time. Once you have deactivated the license, the PRTG installation on this computer will revert to the Freeware Edition 21 after a grace period of 30 days.

Please see also section **Activate the Product** 91.

Update Your License Information

Click **Change License Key** or **Refresh Information** on the PRTG **License** page to update your license. Provide the necessary information and click **Update License** to complete the activation of your license.

If you have any issues with license activation or update, please click the **Contact Support** button to contact us directly via the **Paessler Service Center** in our shop (internet access required).

STEP 1: CHOOSE ACTIVATION TYPE

Activation Type	Define how you want to validate and activate your license. Choose between: ▪ **Automatic (online activation with optional HTTP proxy)**: PRTG will connect to the activation server and validate your license. The license will be activated automatically. For automatic activation, internet access is necessary from the the computer running this PRTG installation. ▪ **Manual (offline activation)**: Choose manual activation if the PRTG server has no access to the internet and cannot connect to activation.paessler.com. This is the default selection if the PRTG server is offline.

STEP 2: VERIFY YOUR PRTG LICENSE

License Name	Enter the License Name that you have received from us, the Paessler AG. It must exactly match. To avoid typing errors, please copy and paste the **License Name**. You will find the label License Owner in some documents from the Paessler shop. License Owner is the same as License Name for which you will be asked while installing PRTG or when you change your license key 89.
License Key	Enter the license key you have received from us, the Paessler AG. To avoid typing errors, please copy and paste the **License Key**. It must exactly match your license key.
System ID	This field shows the system ID, a fixed value assigned to your PRTG installation. This setting is shown for your information only and cannot be changed here.

For offline activation, click **Save to File** to write your license information into a text file. You can then upload this file to request your activation data on the activation page and do not need to enter your license information manually.

STEP 3: ACTIVATE YOUR PRTG

If you select the automatic activation type, you can now update your license. Define if you need an HTTP proxy for the HTTPS connection to the activation server and click **Update License**.

PROXY CONFIGURATION

This option is not available in PRTG on demand.

Use Proxy Server	We recommend that you use PRTG with a direct internet connection. However, if you need to use a proxy, you can configure the relevant settings here. Choose between: ▪ **No, use direct connection to the Internet (default)**: Do not use a proxy. Use this setting if there is a direct internet connection available to the server running the PRTG core server.

PROXY CONFIGURATION

- **Yes, in our network a proxy is mandatory**: Define proxy settings below.

Proxy settings are valid for Auto-Update 3005, Activate the Product 91, obtaining Geo Maps 2824 tiles, and for sending out HTTP, push, and SMS text message Notifications 2921. The sensor types Cloud HTTP 571 and Cloud Ping 580 use these proxy settings as well.

Proxy Server	This setting is only visible if proxy usage is enabled above. Enter the address of the proxy server that you use for outbound connections. Please enter a valid address.
Port	This setting is only visible if proxy usage is enabled above. Enter the port number of the proxy server that you use for outbound connections. Please enter an integer value.
Use Proxy Credentials	This setting is only visible if proxy usage is enabled above. Determine whether the proxy server needs credentials or not. Choose between: ▪ **Yes, the proxy server requires credentials**: Define credentials (username and password) below. ▪ **No, there are no credentials necessary**: Do not use credentials for proxy connections.
User	This setting is only visible if proxy credentials are enabled above. Enter a username for proxy authentication. Please enter a string.
Password	This setting is only visible if proxy credentials are enabled above. Enter a password for proxy authentication. Please enter a string.

STEP 3: REQUEST ACTIVATION DATA

If you select the manual activation type, you have to request your activation data on https://www.paessler.com/activation using your license information. Open the activation page from a computer that can connect to https://www.paessler.com and provide your license information, or upload the license file that you can save above 3014.

Generate the key file for your license and provide this data below.

STEP 4: PROVIDE ACTIVATION DATA

This step is only necessary if you do an offline activation.

- Copy the content of the key file that you have generated on https://www.paessler.com/activation.
- Paste it into the **Activation Data** field. Alternatively, click **Load from File** if you have saved the key file with your activation data.
- Click **Update License** to complete the activation of your license.

8.12.17 Optional Downloads and Tools

To see optional downloads, select **Setup | Downloads** from the main menu. Click a tab to switch between different options.

Downloads Tabs

There are the following downloads available:

- Client App for Windows (Enterprise Console) 3018
- Client Apps for Mobile Devices 3018
- Remote Probe Installer 3018
- PRTG Tools 3019
- Desktop Notifications 3019

Client App for Windows (Enterprise Console)

Download the Windows Graphical User Interface (GUI) Enterprise Console to the current system. If you use the Enterprise Console, you can access the PRTG on premises web interface with a native Windows application. The version of the Enterprise Console must match the version of your PRTG server. For more information, please see **Install the Enterprise Console** 100.

This feature is not available in PRTG on demand.

Client Apps for Mobile Devices

To monitor your network while on the go, use our free apps for smartphones and tablets. They run on iOS, Android (including BlackBerry devices), and on Windows Phone.

For more information on **PRTG for iOS**, **PRTG for Android**, and **PRTG for Windows Phone**, see the Paessler Website: Mobile Network Monitoring with PRTG—Mobile Apps for Smartphones and Tablets

Remote Probe Installer

With remote probes you can extend your monitoring to distributed networks that are not directly reachable from your PRTG core installation. The version of the remote probe installer must match your version of PRTG.

For more information, see section **Install a PRTG Remote Probe** 93.

PRTG Tools

You can use several freeware tools directly from the Paessler labs which help you to manage your network and to diagnose and test network monitoring issues. Open the **PRTG Tools** tab and click the **More Information and Download** button to navigate to our freeware tools webpage. There you can find a collection of various tools for PRTG Network Monitor.

Find all tools on the Paessler Website: Freeware Network Tools

Desktop Notifications

This tab is only visible if you access the PRTG web interface with Google Chrome or Firefox browser.

For details, see section **Desktop Notifications** 3020.

More

Paessler Website: Mobile Network Monitoring with PRTG—Mobile Apps for Smartphones and Tablets

- https://www.paessler.com/apps

Paessler Website: Freeware Network Tools

- https://www.paessler.com/tools

8.12.18 Desktop Notifications

While you are logged in to the PRTG web interface with your Chrome or Firefox browser, PRTG can show notifications on your desktop whenever there are new alarms in your monitoring.

PRTG will show desktop notifications (by default, in the lower right corner of your desktop) whenever there are new alarms after a page refresh in the PRTG web interface. The notification displays the number of new alarms and the current number of each sensor status.

Example of a Chrome Desktop Notification

To enable desktop notifications in the PRTG web interface, choose **Setup | Downloads | Desktop Notifications** from the main menu bar 243. You have to initially allow the notifications for each installation/profile of Firefox or Google Chrome.

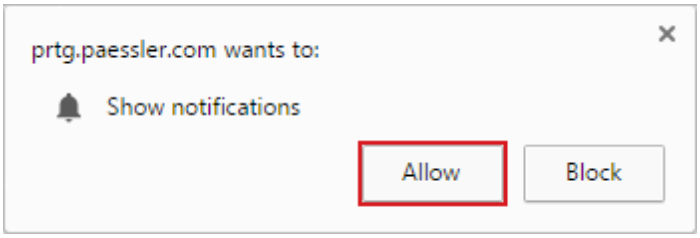
Desktop notifications are not available for Internet Explorer.

Desktop Notifications Settings

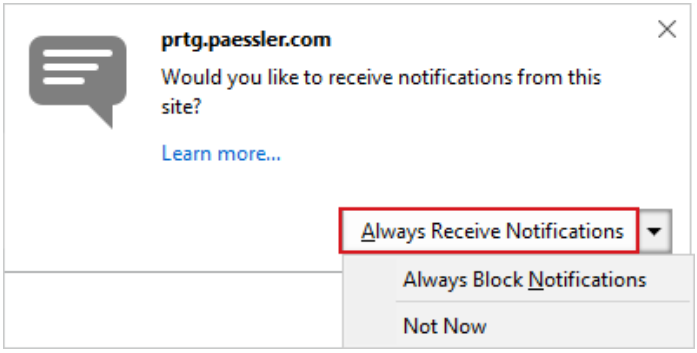
On the settings page, you see one of the following status messages.

Status: Click button below to enable Desktop Notifications

- Click the **Enable Desktop Notifications** button to add your PRTG URL to the list of allowed sites for desktop notifications in Chrome or Firefox.
- On top of your browser window a message appears, asking you to allow desktop notifications.
  - In Chrome, click **Allow** to add the URL of the PRTG web interface to the allowed sites.
  - In Firefox, click **Always Receive Notifications** to add the URL of the web interface to the allowed sites.



Click 'Allow' to enable Chrome Desktop Notifications



Click 'Always Receive Notifications' to enable Firefox Desktop Notifications

Status: Sorry, Desktop Notifications cannot be enabled or **Unknown**

- Desktop Notifications are explicitly blocked for the URL of the PRTG web interface in the browser options. Please see section Disabling or Re-Enabling Desktop Notifications 3021 below.

Status: Desktop Notifications enabled

- Desktop Notifications are successfully activated. To disable them, please see Disabling or Re-Enabling Desktop Notifications 3021 below.

Disabling or Re-Enabling Desktop Notifications

To disallow or re-allow desktop notifications for the PRTG web interface, edit your browser options:

- In **Google Chrome**: Click the **View site information** symbol in the address bar of the browser. You can block or re-allow notifications for the current URL in section **Permissions**.
- In **Firefox**: In the PRTG web interface, hold the Shift key and right-click to open the browser's context menu. Click **View Page Info** and select the **Permissions** tab. In section **Notifications**, select the desired option for the PRTG website, for example, block desktop notifications or enable them again.

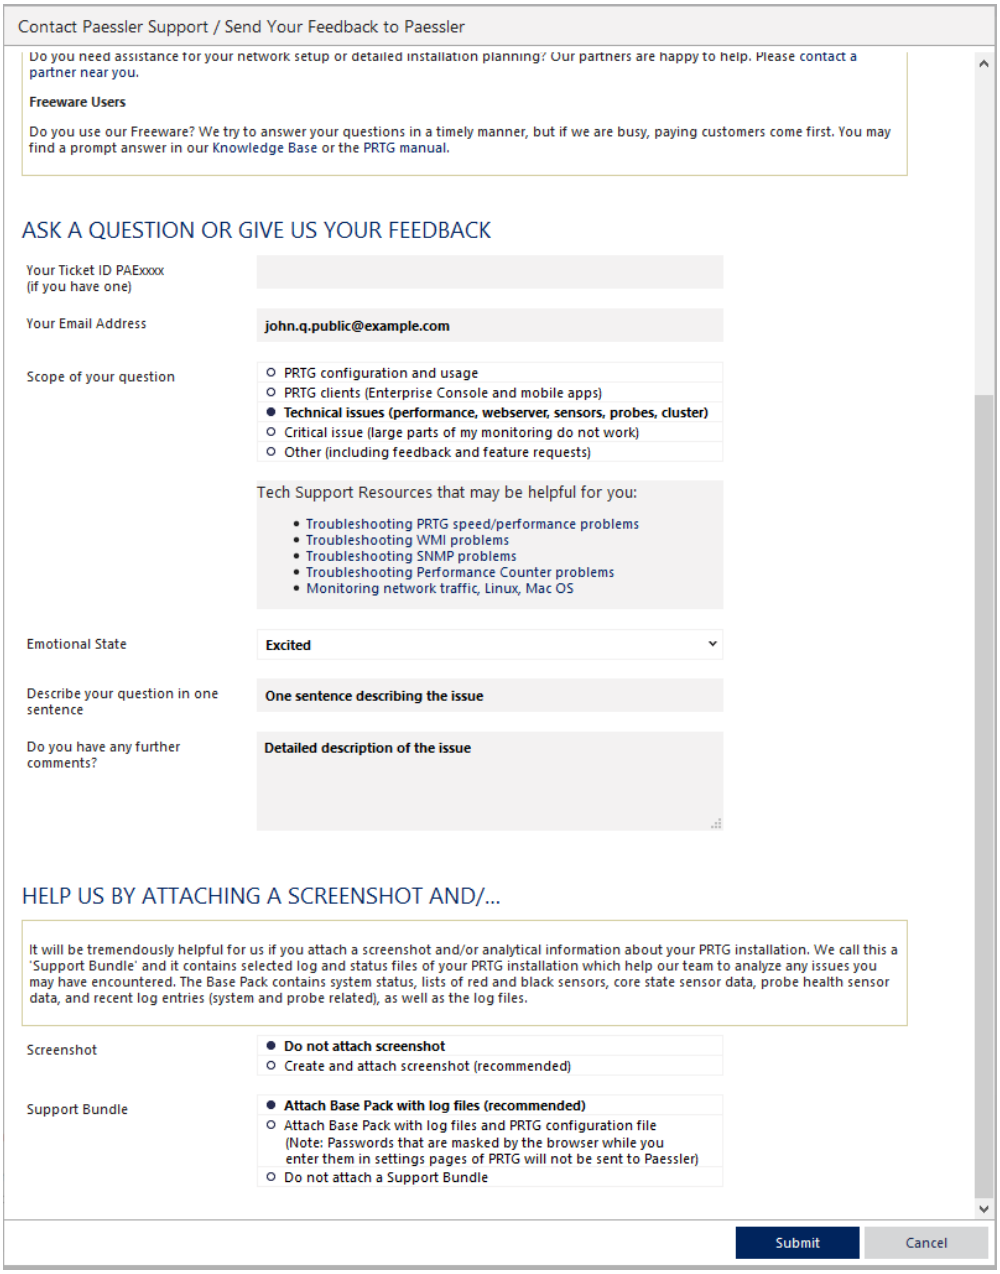
8.12.19 Support—Contact Support

To open the **Contact Paessler Support / Send Your Feedback to Paessler** window in PRTG, choose **Setup | Contact Support** from the main menu. You can open this form also via the footer **Contact Support** on any page in PRTG.

On the one hand, you can adapt this page as feedback form. Help improve PRTG by providing criticism, praise, bug reports, and feature requests. Any comments are welcome! Your feedback will be handled directly by the Paessler support team.

On the other hand, you can use this function to ask for support regarding technical issues. To make the support contact more comfortable, PRTG can automatically attach a screenshot in combination with a Support Bundle which contains several selected PRTG log and status files. This information will help our support team a lot to analyze any issues you may have with PRTG. Please also consider the suggested links to articles regarding the scope of your issue.

PRTG transmits your feedback or support question including the support bundle securely to Paessler via the PRTG Cloud. Please make sure your PRTG server has access to the internet and can reach the URL https://api.prtgcloud.com:443



Contact the Paessler Support or Send Feedback

Ask a Question or Give Us Your Feedback

Provide the following information in this section of the contact form:

- **Your Ticket ID PAExxx**: If you have already opened a new ticket (either directly via email to support@paessler.com, or via the Knowledge Base, or via the support form on paessler.com), enter its ID here. You can find it in your confirmation email regarding the request we received. You can provide the ID with "PAE" in front or just the number. If you leave this field empty, you will create a new ticket when you submit this form.

- **Your Email Address**: Enter your email address here. You can provide any of your addresses; however, recommended and default is the email address of your PRTG account to be able to associate you with your license.
- **Scope of Your Question**: Select a topic regarding your issue and consider the proposed links.
- **Emotional State**: If you want to, you can indicate your current feelings about PRTG.
- **Describe Your Question in One Sentence**: Provide short information with max. 60 characters to indicate the topic of your issue.
- **Do You Have Any Further Comments?**: Leave your comments here. It can be feedback or support questions. Please describe your issue as detailed as possible!

Attach a Screenshot and/or Support Bundle

To provide as helpful information as possible, you can attach a screenshot of the current page and a support bundle with useful analytical data about your PRTG installation.

In section **Screenshot**, choose between:

- **Do not attach screenshot**: Send the ticket without a screenshot.
  We recommend that you attach a screenshot of the affected PRTG webpage so that we can understand your request more easily.

- **Create and attach screenshot (recommended)**: Create a screenshot of the currently displayed page in PRTG to send it with your ticket. You can see a preview below the screenshot section.
  If you encounter issues on a specific page in PRTG, open the contact support form on this page to get a screenshot of it. This is not possible on error pages which are not meaningful enough for our support team to solve your issue.

In the section **Support Bundle**, you can choose between several packages that differ in coverage of information:

- **Attach Base Pack with log files (recommended)**: Contains log files of your PRTG installation and the following information:
  - System status
  - Lists of sensors regarding their current states
  - Core state data
  - Probe Health sensor data
  - Current log entries
- **Attach Base Pack with log files and PRTG configuration file**: Additionally contains the configuration file.
  Send this package only if our support team told you so! Encrypted passwords in the config.dat file and passwords that your browser masks while you enter them on settings pages will be removed before PRTG sends this package to Paessler Support.
- **Do not attach a Support Bundle**: The ticket will not contain files. Choose this option only when sending feedback.

Click the **Submit** button to send your request directly to our technical support team, or click **Cancel** to return to the page from which you opened the contact form. Usually you will receive an answer by our support team within one or two business days, no matter whether you provide feedback or you have a question.

If you have questions or feedback regarding your license purchase, upgrade, or maintenance extension, please contact our customer service 149.

More

Knowledge Base: How does Paessler handle user feedback and feature requests?

- https://kb.paessler.com/en/topic/33873

Part 9

Enterprise Console

9 Enterprise Console

The Enterprise Console (in old PRTG versions called "Windows GUI") is one alternative interface [111] that you can use to connect to the PRTG core server to configure your setup, view monitoring results, and keep an eye on your network. It is a native Windows application for fast access to data and monitoring management.

The Enterprise Console (EC) provides extended pop-up window functionalities, as well as a seamless link to the Ajax web interface [136] where you can change your monitoring configuration and access further functionalities such as reporting [3053], maps [3051], system setup [3059], tickets [3057], and libraries [3045]. The EC shows most of the functions with an embedded webkit browser, for a few options the EC opens an external browser window (using your default browser).

Remarks

The Enterprise Console runs under all supported Windows versions [25], but it is not fully compatible with Windows 10. Running the EC on Windows 10 results in several issues so please use another operating system. We will consider full Windows 10 support for future PRTG desktop clients.

The Enterprise Console does not support **System Information** [193] and does not show this tab on devices. Please use the PRTG web interface to access system information of a device.

PRTG on demand does not support connections from the Enterprise Console. If you want to use it, please connect the Enterprise Console to a PRTG on premises instance.

Access Several Core Servers in One Console

As an additional functionality, you can configure access to several PRTG core servers in the Enterprise Console. It can show data of all your independent core server installations at a glance (for example, the device tree [3038] and alarms list [3049]), so you can manage your monitoring centrally, also when it is spread across different servers.

Getting Started

Every installation of PRTG Network Monitor includes the Enterprise Console and installs it automatically on the computer running the PRTG core server. If you want to use the Enterprise Console on another computer, please download [3018] and install it there. For details, please see the **Install the Enterprise Console** [100] section.

The Enterprise Console is mainly designed to review and manage an existing installation of PRTG that you have already set up. If you just start monitoring, we recommend that you first run through the **Smart Setup** [50] in the PRTG web interface [136] and add your network devices there.

For detailed instructions, see section **Quick Start Guide** [44]. Once finished, you can seamlessly switch to the Enterprise Console.

Requirements for Connections to PRTG Web Server(s)

To show monitoring data of your PRTG setup, the Enterprise Console must be able to establish a connection to your PRTG web server(s). For this purpose, please ensure the following.

- The following server settings in the Enterprise Console have to match the following settings in the **PRTG Administration Tool** 3135.
  See section **PRTG Servers** 3062 for details.

ENTERPRISE CONSOLE SERVER SETTINGS	PRTG ADMINISTRATOR SETTINGS
Server IP / DNS name	**IP address for PRTG's Web Server** on the **Web Server** tab
Port	**TCP Port for PRTG's Web Server** on the **Web Server** tab PRTG switches to port **8080** as a fallback after a restart when port 80 is already used, and to port **8443** if port 443 is not available. PRTG keeps the SSL connection in this case. If this port is also not available, PRTG tries from port 32000 on until it finds an available port. Because the EC cannot recognize these ports (8080, 8443, 32000+) automatically, enter the currently used port manually here in the **Port** setting. If you do not get a connection to the PRTG web server, check the currently used port in the **Web Server** settings under **System Administration—User Interface** 2946 in the PRTG web interface.
Login Name	**Login Name** on the **Administrator** tab
Password	**Password** on the **Administrator** tab

- No local software firewall blocks the connection.
- No local virus protection program blocks the connection.
- The specified port is not used by another application.
- No (hardware) firewall blocks the connection when connecting through a network (LAN or WAN).
- The software versions of the Enterprise Console and the PRTG web server have to match at least in the third number (for example, EC version 3035 15.3.18.3590 can connect to server version 151 15.3.18.3796).

For common issues with the Enterprise Console and their solutions, see this Knowledge Base article: Problems with the Enterprise Console: What can I do?

- Ajax Web Interface—Device and Sensor Setup 248
- Ajax Web Interface—Advanced Procedures 2804
- Other User Interfaces

9.1 First Start

This section helps you to start the Enterprise Console for the first time.

Open the Enterprise Console

Double click the **PRTG Enterprise Console** icon in the Windows start menu to open it. As soon as it opens, the Enterprise Console tries connecting to your PRTG installation, according to the defined PRTG server connection settings. In a fresh install of PRTG, the settings for the Enterprise Console installed on the computer running the PRTG core server are already predefined, so you can use the Enterprise Console right away. If you get an error message when opening the Enterprise Console, please check the connection settings 3029. For example, adjusting the settings is necessary if you changed the IP address of the server.

For detailed information, see section **PRTG Servers** 3062 (**PRTG Server Connection**).

Remarks

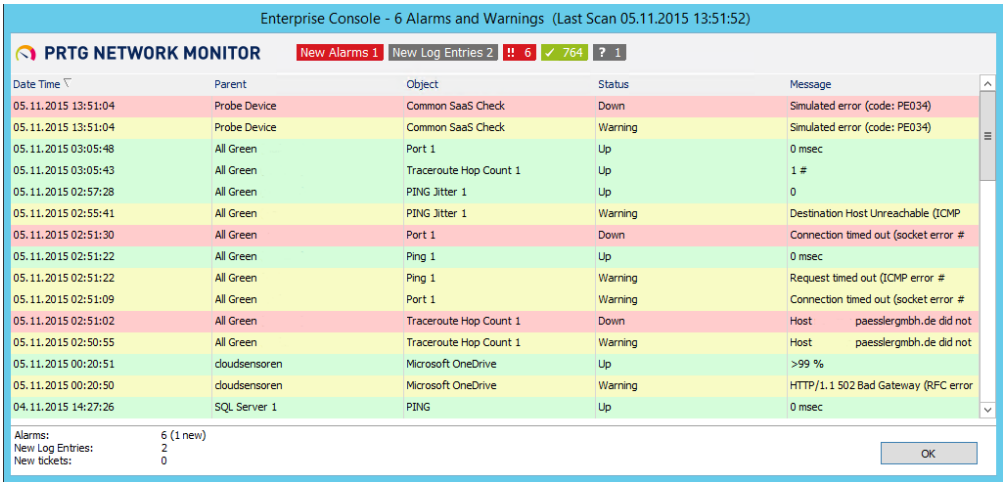
The Enterprise Console runs under all supported Windows versions 25, but it is not fully compatible with Windows 10. Running the EC on Windows 10 results in several issues so please use another operating system. We will consider full Windows 10 support for future PRTG desktop clients.

The Enterprise Console does not support **System Information** 193 and does not show this tab on devices. Please use the PRTG web interface to access system information of a device.

PRTG on demand does not support connections from the Enterprise Console. If you want to use it, please connect the Enterprise Console to a PRTG on premises instance.

Tray Window

By default, the Enterprise Console runs in background and shows a message box whenever there are new alerts, new messages, or new tickets for your monitoring. This window is one of the first things you see after opening the Enterprise Console.



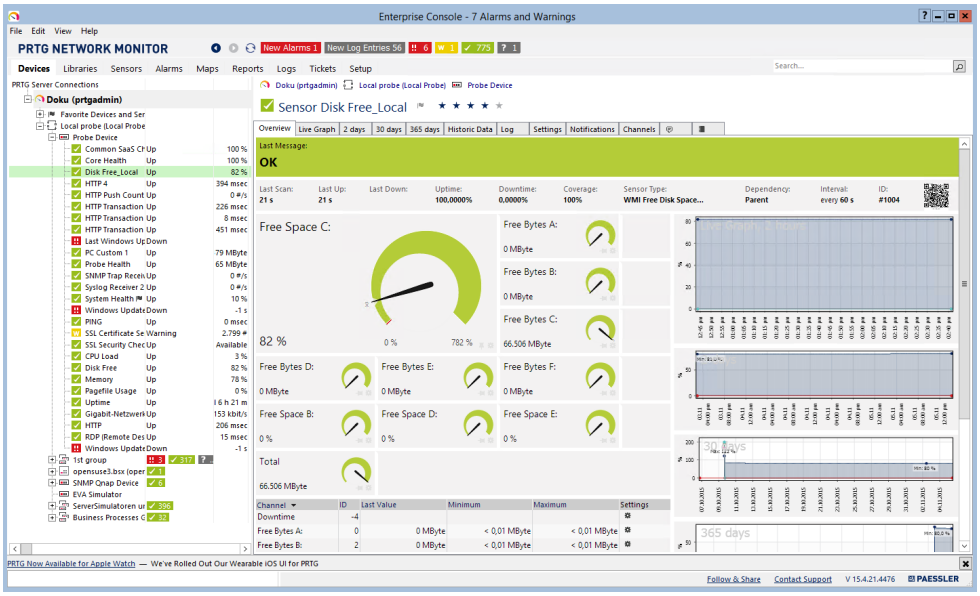
Example of the Tray Window

This window is always shown on top. Click the **OK** button to close it. You can change the tray behavior in the Enterprise Console settings.

For detailed information, see section **Options** 3067 (**System—Alerting**).

9.2 General Layout

The main layout of the Enterprise Console (EC in short form) program consists of different elements. See below for details.



PRTG Enterprise Console

From top to bottom, the main layout consists of:

- The Windows menu 3034.
- The page header bar 3034 with the PRTG logo, the viewpoint arrow symbols, the refresh icon, and the sensor states overview.
- The menu tabs bar and page content 3034 underneath.
- The server selection 3035 and search bar 3035 in the upper right corner.
- The news feed 3035 underneath the page content.
- The status bar 3035 at the bottom of the window.

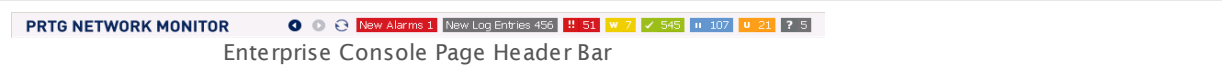
Often, the Enterprise Console displays data and settings directly. Some functionalities and extended setup additionally require a new window of the system's default browser and the web interface 136 shows up. In this case, you are logged in to the web interface automatically via username and hash value 2909. In your browser, it might be necessary to confirm the certificate that is used by the PRTG web server. For more information, please see **SSL Certificate Warning** 142 section.

If you configure your Enterprise Console for a connection with more than one PRTG core server, keep an eye on the server selection 3035 bar to choose which server's data you want to access.

Windows Menu

The Windows menu gives access to general configuration and settings. For details, please see section **Windows Menu Structure** 3071.

Page Header Bar



Enterprise Console Page Header Bar

The page header consists of the following parts:

- **PRTG Logo**
  Click the PRTG Network Monitor logo to open the Ajax web interface 136 in the browser which you define in the Enterprise Console **Options** 3065. If you configured several PRTG core servers, the browser loads the web interface of the server that you have currently selected in the **Devices** 3038 tab.

- **Previous Viewpoint / Next Viewpoint (Arrow Symbols)**
  The Enterprise Console stores the different views which you navigate to in the application. Using these arrows (or using the shortcuts Alt+Left and Alt+Right), you can step back and forth in the history, just as you know from your web browser.

- **Refresh (Arrow Circle Symbol)**
  Click the refresh symbol (F5) any time to refresh the current screen. This immediately queries data for the current screen from all active PRTG core servers just as the automatic refresh does. You can configure the update interval in the **Options** 3065 settings.

- **Global Sensor Status Symbols**
  This area shows the aggregated status of all sensors from all active PRTG core servers, divided into different sensor states. Depending on the particular sensor states, you see colored boxes with numbers which symbolize the sensors. For example, you can see how many sensors are in **Up**, **Down**, **Warning**, **Pause**, **Unusual**, or **Unknown** status 163. Click a status icon to view a list of all sensors in the respective status.
  Next to the global sensor status symbols you can also see the number of new alarms and new log entries, as well as the number of new tickets, if there are any. Click the respective icons to view **Alarms** 190, **Logs** 198, or **Tickets** 200.
  When you view sensor lists, you can only show the sensors of one server at once. So, the global sensor overview shows the total number of sensors in a certain status on all active servers, but viewing a list of all sensors in a certain status from all servers is not possible for performance reasons.

Menu Tabs Bar and Page Content

You can navigate through your setup using the menu tabs bar. Please take a few minutes to familiarize yourself with all menu items. The page content underneath varies depending on the selected menu tab. It shows various information about your monitored objects.

For a detailed description of all tabs, see section **Menu Tabs and Page Content** 3037.

Server Selection

Enterprise Console's Server Selection and Search Bar

In the server selection bar you see all active PRTG core server connections that are configured for the current Windows user account (saved in the registry).

The server you select here determines globally which information the EC shows in all **Menu Tabs** 3037 (except the **Devices** tab: the server selection does not apply for the devices tab). Depending on your selection, **Libraries**, **Sensors**, **Alarms**, **Maps**, **Reports**, **Logs**, **Tickets**, and **Setup** options are shown for the respective server only. Select **All PRTG Servers** to show consolidated information for all active PRTG core servers which appear in the list.

For technical reasons, you cannot show consolidated information from all servers in the **Sensors**, **Setup**, and **Search Results** tab. To use these tabs, please select one single PRTG core server from the server selection bar.

Select **File | Manage PRTG Server Connections** from the main menu 3071 to add or remove **PRTG Servers** 3062 from the list, or to edit an existing one.

Search Bar

Select a single PRTG core server from the server selection 3035 bar and enter a key word to search the respective server. In the **Search Results** tab, the Enterprise Console displays matching monitoring objects, help topics, and related objects. If you click a monitoring object (for example, a sensor) in the search results, the Enterprise Console opens this object on the **Devices** 3038 tab with details in the device tree.

If you have configured a connection in the **PRTG Servers** 3062 options that uses a **Root ID** 3064 other than 0, the EC will ignore this setting while searching. In this case, the EC shows **Search Results** for the entire server (starting at Root ID 0).

News Feed Bar

The news feed bar shows latest news by Paessler. Click the bar to open a window with an overview about recent articles. You can open a specific article in the web browser by clicking the particular header. If you do not want to show the news feed in your Enterprise Console, click the X symbol besides the bar. You can enable it again via **View | Show News Feed** in the main menu 3076 (Ctrl+N).

Status Bar

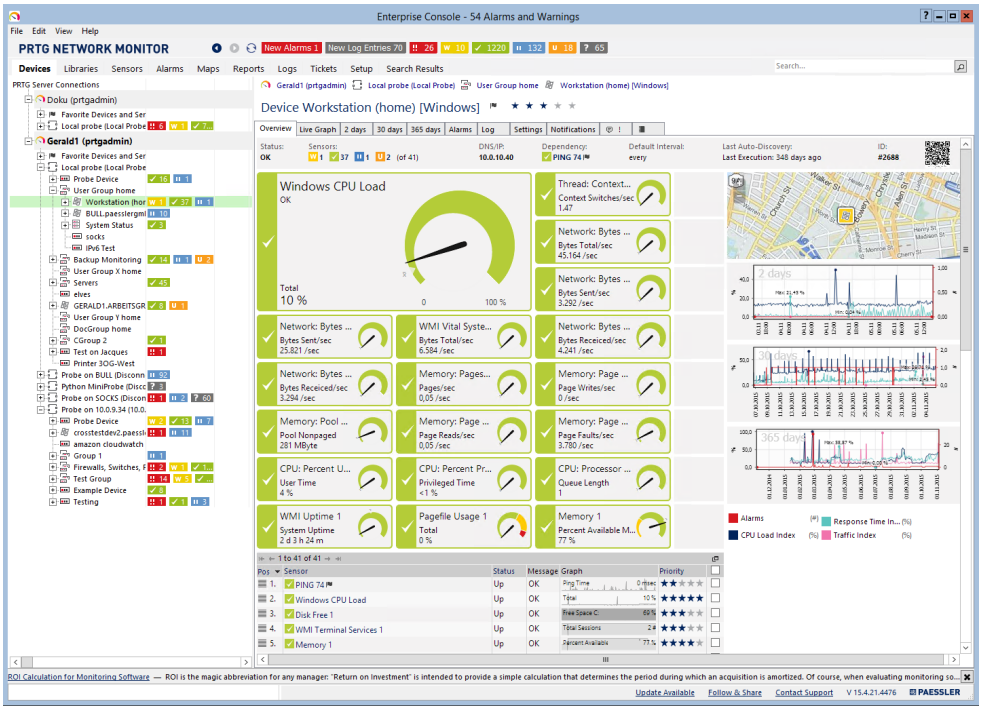
Enterprise Console Status Bar

The status bar shows the version number of your PRTG Enterprise Console and the Paessler logo which leads you to the Paessler website when you click it. Furthermore, the status bar contains a **Contact Support** 3022 link which opens a window to leave feedback or to ask for support, and a **Follow & Share** link which opens PRTG's social network contact information in the Ajax web interface.

You will also see a note if an update for one of connected servers is available. Click **Update Available** to open the **Auto-Update** 3005 page in the EC.

9.3 Menu Tabs and Page Content

Under the different menu tabs of the Enterprise Console, you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example.



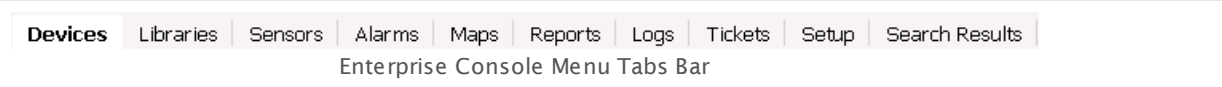
PRTG Enterprise Console — Device Details

The following sections introduce the available options within the different tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

9.3.1 Devices

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Devices Menu Tab

The **Devices** tab is your starting point for everyday use. The page is split into two parts. On the left hand side, it shows the tree-like device view which lists all configured PRTG core servers with their probes, groups, devices, and the sensors on the devices, in a hierarchical order. Next to each object you see an overview of the number of sensors, grouped by their current status.

The first child node of the tree is called **Favorite Devices and Sensors**. It contains all devices and sensors that you marked as favorites 211. To add an object to the favorites list, right-click the desired device or sensor and select the **Add to Favorites** entry from the context menu 215.

For more information about the hierarchical order of the different objects in the device tree, see section Object Hierarchy 118.

On the right side you see details about the object selected on the left. The information is spread over several tabs.

Over the object's name you see always a path which you can use to navigate through the device tree. It can also help you to orient yourself if you get lost. If you click a breadcrumb item, a drop-down menu opens that shows all available objects on the same level. For example, you can use this to directly access all other sensors or a device, other devices within a group, another group on the same probe, other probes in your root group, or another PRTG server.

Enterprise Console Sensor Sub-Tabs on the Device Tab

Edit Objects in the Device Tree

Use the **Edit** menu (or the object's context menu 3079) to access different important functions of the items you have currently selected in the device tree on the left hand side.

- Add devices or sensors to the favorites list (or remove them from the list)
- Sort all sub nodes of an object alphabetically
- Move objects up and down in the tree
- Check now
- Pause monitoring
- Access tools
- and many more

For details about the available options, see section **Windows Menu Structure** 3071.

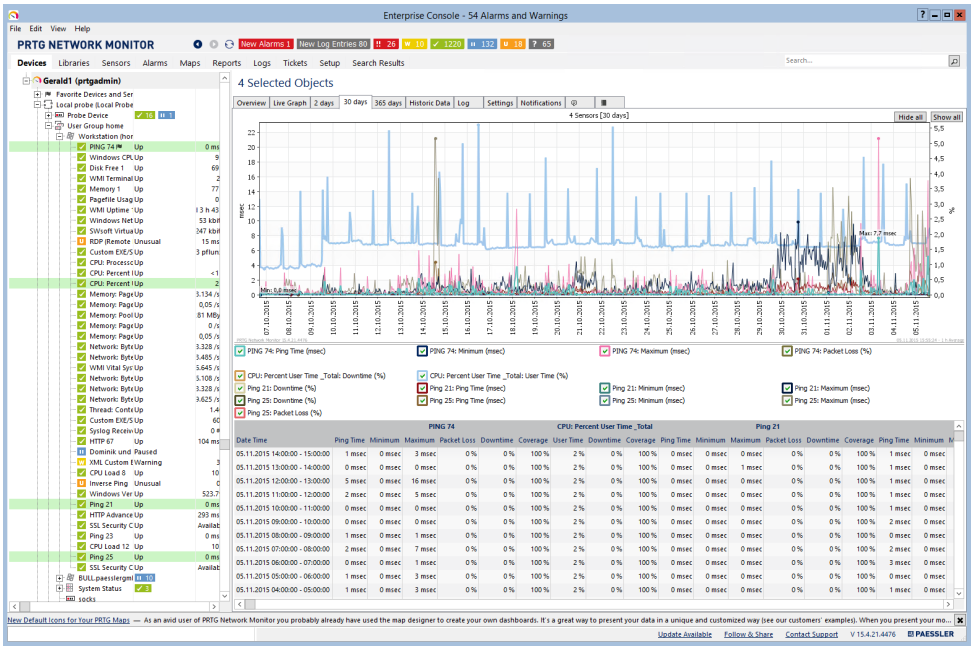
Select Multiple Items in Device Tree

In the device tree shown on the left, you can select one or more objects, even from different PRTG core servers. Hold down the Ctrl key to select more objects simultaneously with your mouse. Usually, you select more than one item to view combined graphs, or to apply a command from the **Windows Menu** 3071 (for example, **Check Now** or **Pause**) to several objects.

When you select multiple items, the sub-tabs on the right side show data for all selected items at a glance. For example, when if you select two sensors, you see their tables next to each other. Graphs will actually appear combined! This is a great way to instantly show one chart containing the graphs of all selected objects. Each sensor channel is represented as one line. This aggregated view works for all kind of objects.

The tab **Live Graph** shows data for sensors only.

Below each graph you see a key. Hover over an entry in the key to display the corresponding line in the graph above in **bold**.



Aggregated Graph View in Enterprise Console

You may need to enlarge the Enterprise Console's window to see all tables and graphs.

Devices—Overview

The **Overview** tab shows general information about the selected object. Depending on the selected object selected, you can see different information.

- For servers, probes, and groups the table shows information in the **Name** and **Status** section, such as priority, parent objects and number of sensors on this object. Additionally, the window shows a geographical map, if enabled in your PRTG configuration as well as in the Enterprise Console's **View** 3076 menu, and index graphs 168.
  For detailed information about geographical maps, see section **Geo Maps** 2824.

- For devices, the **Overview** tab shows device details and summary graphs for different time spans, gauges, as well as a list of all sensors on this device, recommended sensors 184, and a geo map.

- For sensors, the **Overview** tab shows sensor details, current status, and the last value of all sensor channels, as well as sensor graphs for different time spans. You can also edit channel settings in this tab by clicking on a channel's gear icon.
  For details, see section **Sensor Channels Settings** 2782.

Devices—Live Graph, 2 days, 30 days, 365 days

These tabs are only available if you enable the **Large Single Graph** (Ctrl+L) view in the **Windows Menu** 3076 (**View**).

For **Small Multiple Graphs** view, see section **Devices—Graph** 3041 below.

Select one of the tabs to display an object's monitoring results as **Live Graph** (content available for sensors only), or for different time spans in more or less detail (**2 days**, **30 days**, **365 days**). On every tab, you will see graphs as well as data tables.

While you view a sensor graph, you can hide single sensor channels individually. Remove the check mark symbol in front of a channel name underneath the graph, and the line of the according channel disappears. You can also **Show all** or **Hide all** channels by clicking these buttons in the graph. The graph view is reset immediately.

The days mentioned here are the default setting. You can change the detail of the different graphs any time under **System Administration—User Interface** 2950.

Below each graph you see a key. Hover over an entry in the key to display the corresponding line in the graph above in **bold**.

Devices—Graph

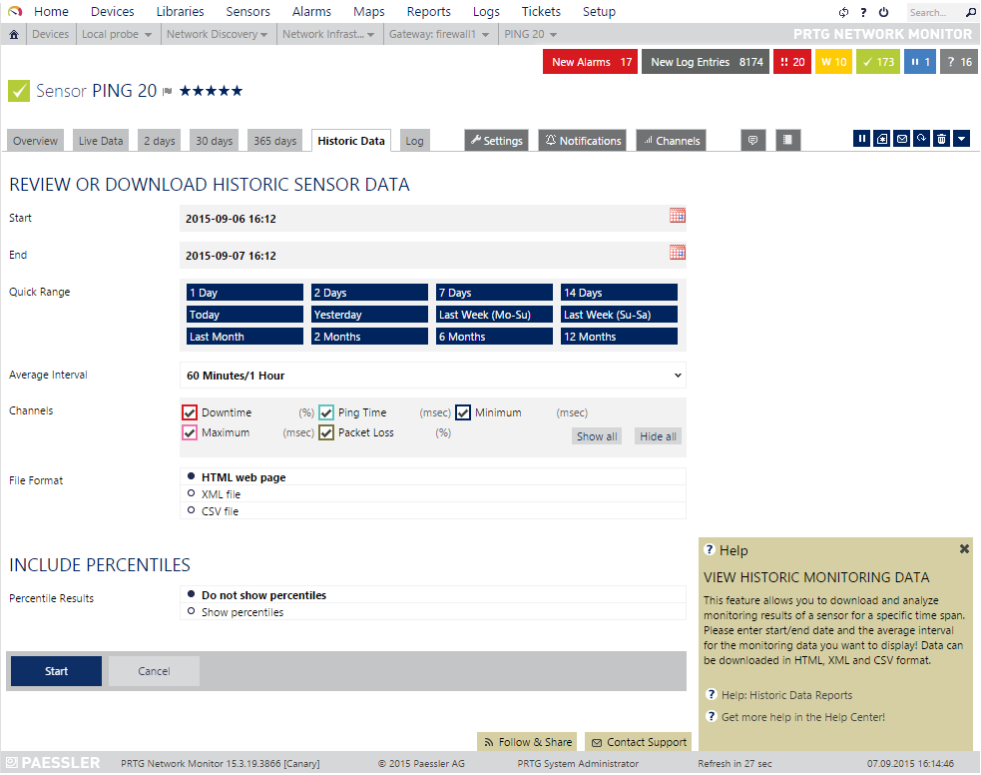
This tab is only available if you enable the **Small Multiple Graphs** (Ctrl+S) view in the **Windows Menu** 3071 (**View**). For **Large Single Graphs** view please see above 3040. This tab shows an overview with single graphs and data tables for live data, 2 days, 30 days, and 365 days. It might be necessary to enlarge the window to display all graphs.

The days mentioned here are the default setting. You can change the detail of the different graphs any time under **System Administration—User Interface** 2950.

Below each graph you see a key. Hover over an entry in the key to display the corresponding line in the graph above in **bold**.

Devices—Historic Data

The **Historic Data** tab is available for sensors only (not for probes, groups, or devices). When you open the historic data tab of a sensor, there is no sensor selection available. If you want to select a different sensor for the report, select **Sensors | View Historic Data** from the main menu in the PRTG web interface.



Historic Data Tab of Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/historic_data_tab_ping_sensor.png

Select the **File Format** for the results:

- **HTML web page**: Opens a new browser window with the historic data report
- **XML file**: Opens a new browser window with the historic data report as XML file.
- **CSV file**: Opens a new browser window with the historic data report as CSV file.

When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's **Options** 3069 will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, please find more information in section **SSL Certificate Warning** 142.

View and functionality are the same as in the web interface. For details about the available **Historic Data** report options, see section **Historic Data Reports** 175 of the Ajax Web Interface 136 documentation.

Devices—Log

Click the **Log** tab to show a table list with all log information on this object. This is a subset of the entries available via the **Logs** 3055 menu tab.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

Devices—Settings

The **Settings** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface. For every type of object and for every sensor, different options are available. For detailed information, please see the following sections (depending on the selected object) in the Ajax Web Interface 136 documentation:

- **Probe Settings** 312
- **Group Settings** 334
- **Device Settings** 360
- **Sensor Settings** 384

Devices—Settings—Multi-Edit

If you select several objects on the left side, the **Settings** tab switches into multi-edit mode 2814. Using multi-edit, you can set a check mark for one or more settings. All changes apply to all selected objects. The multi-edit dialog displays settings which are common among the selected objects only.

If you select only sensors on the left side in the device tree, the **Settings** tab additionally displays a **Channel Settings** tab. Using this tab you can multi-edit the settings of any channels 2782 which are common among the selected sensors, as long as the channels have the same name. Set a check mark for one or more channel settings. All changes apply to all selected sensors.

You cannot use multi-edit for objects on different PRTG core servers.

Devices—Notifications

The **Notifications** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface. You can set different notification triggers.

For detailed information, see section **Sensor Notifications Settings** 2791 in the Ajax Web Interface 136 documentation.

You cannot change notification settings for multiple objects at a time. We recommend that you use the **Inheritance of Settings** 122 for easy configuration.

Devices—Comments

The **Comments** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface.

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Devices—History

The **History** tab shows all changes to the settings of an object with a timestamp, the PRTG user which conducted the change, and a message.

Drag & Drop Sorting in Device Tree

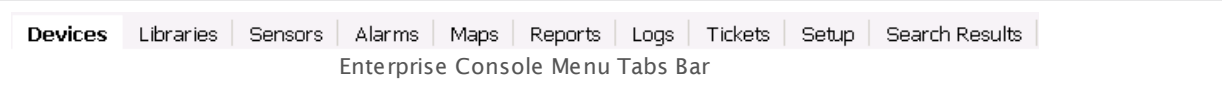
In the device tree, you can also move probes, groups, and devices simply via drag and drop. Activate it in the Windows menu 3071 under **Edit | Drag & Drop Sorting** and then drag your objects as you like: You can move devices and groups, or add groups or devices to other groups. You can also move objects via the context menu 3079.

You cannot move objects in the following cases:

- You cannot move any objects from one PRTG core server to another.
- You cannot move sensors from one device to another. To clone sensors to other devices using drag & drop, please use the Ajax Web Interface 136.
  For detailed information, see section **Manage Device Tree** 292.
- You cannot move devices from one group to another.
- You cannot move groups from one probe to another.
- You cannot move probes from one core server to another.

9.3.2 Libraries

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Using Libraries is a great way to keep an eye on your network status because you can individually select which sensors you would like to see there.

For a general introduction to PRTG Libraries, see section Libraries 2845.

Libraries Menu Tab

The page is split into two parts. On the left hand side you see all available libraries from one or several servers, on the right hand side the actual libraries.

- Click a library's name to display it. In the tabs above the library, select from Overview 2845, Management 2852, Settings 2855, Notifications 2829, Comments 2859, and History 2860. Each of these tabs loads the respective functionality of the Ajax Web Interface 136. Click the **Save** button to apply changes to your settings.
- Underneath the tabs bar, there are different options available to change the current library view: You can set sensor filters (set or remove check marks to include or exclude sensors in a certain status) and change the device tree view.
  For details about the tree view, see section General Layout—Tree View Layout 151.
- Click a library node to edit the node settings 2855 in a new window.
- Double-click a library's name on the left to open the library in the configured external web browser. You can edit it or add new libraries to this PRTG server.

- Right-click a library's name to open its context menu 3079. The following options are available: **Add**, **Edit**, **Delete**, **Clone**, **Send link by email**, and **Open in Web Browser** in the libraries overview on the left, **Details...**, **Edit**, **Remove from Library...**, **Add Library Node...**, **Add Group...**, and **Send Link by Email** on the **Overview** tab of a specific library on the right.
- Use the button **Add Library** to create a new library and the button for object history 241 to view all changes to libraries.

For more details about PRTG Libraries, see section **Libraries** 2845.

Libraries Menu Tab—Add Library

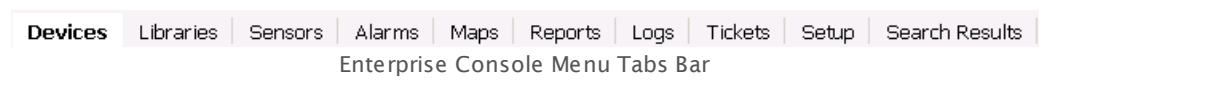
Click the **Add Library** button to add a new library to a PRTG server.

Depending on the current setting shown in the server selection 3035 bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a library, see section **Libraries Step By Step** 2848.

9.3.3 Sensors

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Viewing lists of sensors is a great way to keep an eye on your network status because you can select which kind of sensors you want to see. You can filter by various parameters like object or sensor type, for example, and current sensor status.

Sensors Menu Tab

For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, choose one server from the server list in the upper right corner.

Click the **Sensors** entry in the menu tabs bar to show a table list of all sensors. You can enable a filter to only show certain sensors. To do so, choose from three different drop down menus to build a filter. With each filter you can further decrease the number of shown sensors.

- **By Type**
  The second drop down menu shows all sensor types 385 available in your monitoring setup. Select an entry to only show sensors of this type. The default value is **All Types**.

- **By Status**
  The third drop down menu shows all possible sensor states[163]. Select an entry to only show sensors that currently show this status. Choose between **All States**, **Down**, **Down (Acknowledged)**, **Down (Partial)**, **Warning**, **Up**, **Paused**, **Unusual**, and **Unknown**. The default value is **All States**.
  If you click a sensor symbol in the page header bar[3034], you can directly view a sensor list filtered by the selected sensor status for the selected server.

If you have filtered out all sensors and the list below shows no entries, remove some filters by reverting them to the default values.

In the column **Last Value**, the table only shows the last value of the sensor's **primary channel**.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

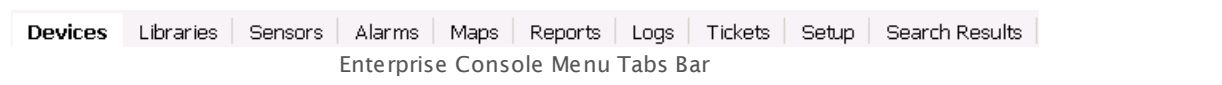
From this list view, you can select multiple items to apply the same action to them, for example, **Edit | Check Now**.

You can select multiple items by the following means (you can also combine them):

- Click and hold your left mouse key while pointing to the lines you want to select
- Hold the Ctrl key while clicking to toggle the selection status of a single line
- Click a line and hold the Shift key while clicking another line to select all lines in between.

9.3.4 Alarms

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Alarms Menu Tab

In the **Alarms** tab you can show the alarms of all active PRTG core servers. To do so, select **All PRTG Servers** from the server selection in the upper right corner.

The alarms list shows all sensors that are currently in a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. Sensors in other states (for example, **Up**, **Paused**, or **Unknown**) do not appear here. This is useful for keeping track of all irregularities in your network.

Using the options **Error**, **Warning**, and **Unusual**, you can hide and show sensors in the respective status by removing and adding a check mark. When choosing **Error**, this includes sensors in the states **Down**, **Down (Partial)**, and **Down (Acknowledged)**.

Click **Show as Gauges** to show the sensors on the **Alarms** tab represented with gauges 166.

If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

From this list view, you can select multiple items to apply the same action to them, for example, **Edit | Check Now**.

You can select multiple items by the following means (you can also combine them):

- Click and hold your left mouse key while pointing to the lines you want to select
- Hold the Ctrl key while clicking to toggle the selection status of a single line
- Click a line and hold the Shift key while clicking another line to select all lines in between.

Acknowledge Alarm

An acknowledged alarm shows up in the alarms list as "acknowledged" (see **Sensor States** 163) and will not trigger 2791 any more notifications 2829.

If the alarm condition clears, the sensor usually returns to an **Up** status immediately with the next sensor scan.

To acknowledge an alarm, right-click a sensor entry and choose **Acknowledge Alarm...** from the context menu, enter a message and click the **OK** button. The message will appear in the last message value of the sensor. You can choose between: **Acknowledge Indefinitely...**, acknowledge **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**.

If you choose **Until...** a dialog box appears:

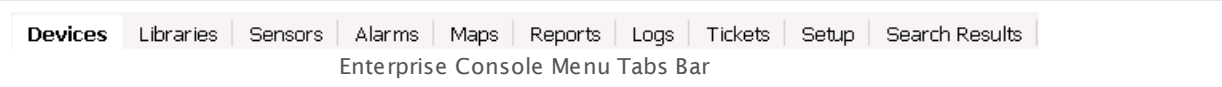
ACKNOWLEDGE ALARM UNTIL

Selected Objects	Shows the sensor(s) that you want to acknowledge the alarm for. You can acknowledge alarms for more than one sensor using multi-edit 2814.
Message	Enter a text, for example, the reason why you acknowledge the alarm. Please enter a string or leave the field empty.
Until	Enter the date when the acknowledge status will end. Use the date time picker to enter the date and time. If the alarm condition still persists after the specified date, the sensor will show a **Down** status again.

Only users 2975 with write access rights may acknowledge alarms. You can give read-only users the right to acknowledge alarms, too. See section **User Accounts Settings** 2976, section **Account Control**.

9.3.5 Maps

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Maps Menu Tab

The page is split into two parts. On the left hand side you see all available maps from one or several servers, on the right hand side the details of the selected map.

- Click a map's name to display it. In the tabs above the map, select from **View Map**, Map Designer 2893, Settings 2902, Get HTML 2905, Comments 2906, and History 2906. Each of these tabs loads the respective functionality of the Ajax Web Interface 136. Remember to click the **Save** button to apply your settings.
- Double-click a map's name to open the map in the configured external web browser. You can edit it using the Map Designer 2893, or add new maps to this PRTG server.
- Right-click a map's name to open a context menu 3079. The following options are available: **Add**, **Edit**, **Delete**, **Clone**, **Send link by email**, and **Open in Web Browser**.
- Use the **Add Map** button to create a new map and the button for object history 241 to view all changes to maps.

For more details, see section Maps 2885.

Maps Menu Tab—Add Map

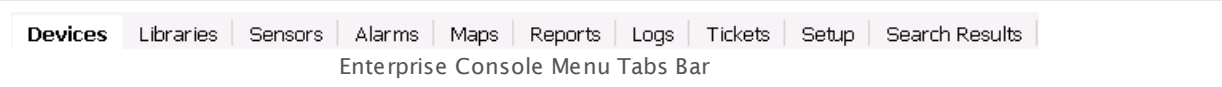
Click the **Add Map** button to add a new map to a PRTG server.

Depending on the current setting shown in the server selection 3035 bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a map, see section **Maps Step By Step** 2890.

9.3.6 Reports

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Reports Menu Tab

On the **Reports** tab you see all available reports from one or several servers in one list.

If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

Choose one report and double click its name to open its details. The page will split into two parts. On the left hand side you see all available reports from one or several servers, on the right hand side the options for the currently selected report.

- Click a report's name in the list on the left to display its options. In the tabs above the report, select from Run Now 2870, Stored Reports 2872, Settings 2873, Select Sensors Manually 2882, Sensors Selected by Tag 2884, and Comments 2884. Each of these tabs loads the respective functionality of the Ajax web interface 136. Remember to click the **Save** button to apply your settings.
- Right-click a report's name to open its context menu 3079. The following options are available: **Add**, **Run Now**, **Edit**, **Delete**, **Clone**, **Send link by email**, and **Open in Web Browser**.
- Use the **Add Report** button to create a new report and the button for object history 241 to view all changes to reports.

For details, see section Reports 2862.

Reports Menu Tab—Add Report

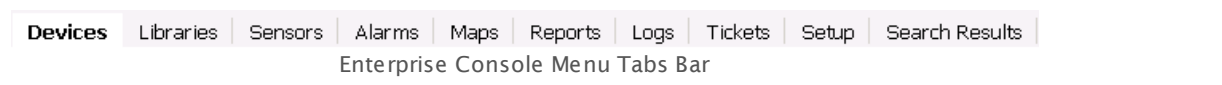
Click the **Add Report** button to add a new report to a PRTG server.

Depending on the current setting shown in the server selection 3035 bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a report, see section **Reports Step By Step** 2866.

9.3.7 Logs

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Logs show all past activities and events of your PRTG monitoring setup. This is useful for researching past user activities, system events, and, for example, to check whether messages were sent. In a typical setup, a huge amount of log data is produced. Because the activity of every single object is recorded, you can use this information to check if your setup works exactly as desired.

There are two options to call the logs list: Either you click the **Log** tab while you view an object's details on the Devices 3042 menu tab, or you choose the **Logs** entry from the menu tabs bar.

Logs Menu Tab

Click the **Logs** entry in the menu tabs bar to show a list of all log entries of a PRTG core server.

You can either view the entries of one or all servers. If you have configured more than one PRTG core server and you want to view entries from all servers in your PRTG Servers 3062 setup, simply select **All PRTG Servers** from the server selection in the upper right corner.

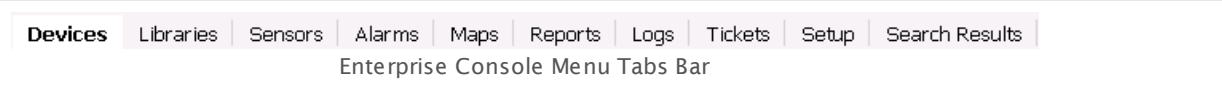
You can enable a filter to only show log entries of a certain event from the categories **Status Changes**, **System Events**, and **Object History**. Choose a category from the **Show** menu. The second drop down menu shows all possible event types for the selected category. Select an entry to only show events of the respective event type. Choose a sensor status 163 for status changes, **Probe Related**, **Auto Discovery**, **Notifications**, or **Status Messages** for system events, or a system object for object history 198.

You can also define the time span for which you want to show logs. Use the date time picker to enter the date and time.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

9.3.8 Tickets

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Tickets Menu Tab

For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, choose one server from the server list in the upper right corner.

On the **Tickets** tab you can view all tickets on the currently selected PRTG core server.

You can only display tickets from one server at the same time, not from all PRTG servers.

In the header bar of the tickets list, you can choose several filters to find and display certain tickets: by status, type, concerned user or user group, related monitoring objects, and last edit. Click the X symbol to undo the date selection.

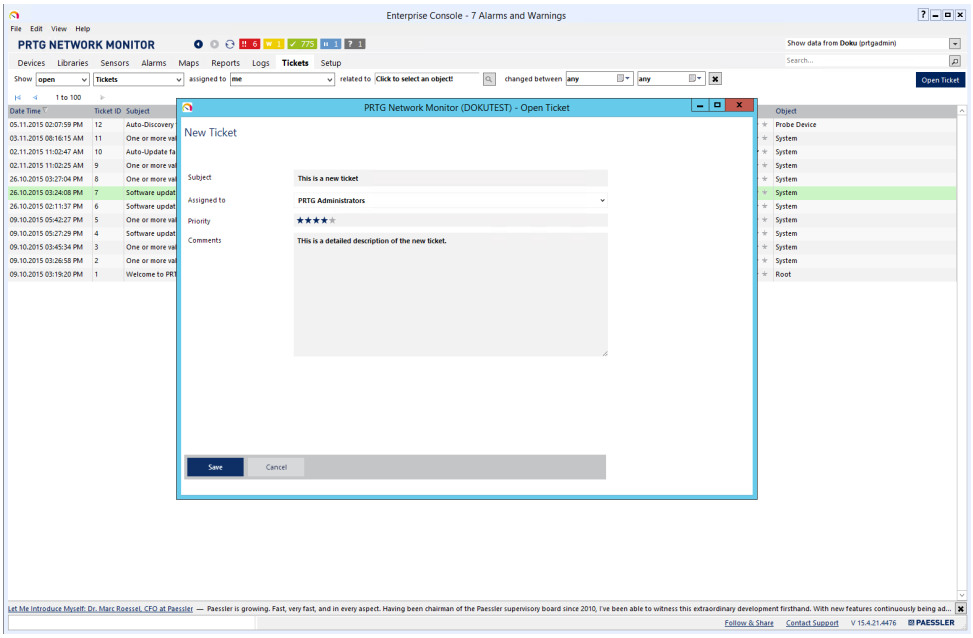
Double-click an entry in the tickets list to open a ticket in a new window and to conduct ticket related actions (edit, assign, resolve, close, or reopen). You can also multi-edit tickets via the context menu: mark several tickets by holding Ctrl or Shift and clicking on the corresponding tickets. Right-click a ticket to open the context menu.

The following actions are available: **Open Ticket**, **Edit Ticket**, **Assign Ticket**, **Resolve Ticket**, **Reopen Ticket**, **Close Ticket**, **Priority/Favorite**, **Open in Web Browser**.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

Tickets Menu Tab—Open Ticket

To open a new ticket, click **Open Ticket** in the upper right corner or in the context menu. Select a related object, click **Continue**, and provide **Subject**, **Assigned to**, **Priority**, and **Comments**. Once finished, click **Save** to create the ticket.

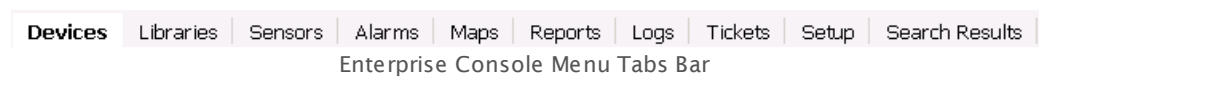


Open Ticket Dialog in PRTG Enterprise Console

For details about working with the PRTG ticket system, see section Tickets 200 for the PRTG web interface.

9.3.9 Setup

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Setup Menu Tab

For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, choose one server from the server list in the upper right corner.

On the **Setup** tab you can access all options available in the Setup 2907 menu of the Ajax web interface. You can collapse and expand the sections by clicking the – or + symbol.

For more information, please refer to the respective section in the documentation for the PRTG web interface.

Account Settings:

- My Account 2909
- Notifications 2916
- Notification Contacts 2934
- Schedules 2938

System Administration:

- User Interface 2943

- Monitoring 2955
- Notification Delivery 2961
- Core & Probes 2967
- Administrative Tools 2987
- Cluster 2992 (available in a cluster 116 setup only)

User Accounts:

- You see a list of configured user accounts. Select one to change settings. For details, please see User Accounts 2975 section.

User Groups:

- You see a list of configured user groups. Select one to change settings. For details, please see User Groups 2982 section.

PRTG Status:

- System Status 2994
- Cluster Status 3010 (available in a cluster 116 setup only)
- Licensing Status and Settings 3012
- Auto Update 3005

Optional Downloads and Add-Ons:

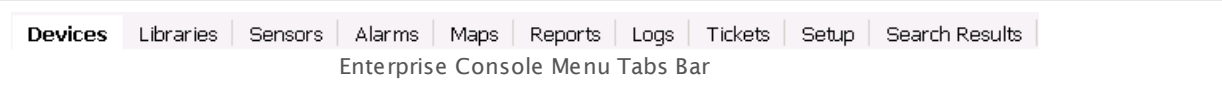
- Client App for Windows (Enterprise Console) 3018
- Client Apps for Mobile Devices 3018
- Remote Probe Installer 3018

Support:

- Contact Support 3022

9.3.10 Search Results

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 3038
- Libraries 3045
- Sensors 3047
- Alarms 3049
- Maps 3051
- Reports 3053
- Logs 3055
- Tickets 3057
- Setup 3059
- Search Results 3061

Search Results Menu Tab

For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, choose one server from the server list in the upper right corner.

The **Search Results** tab is only visible if you do a search using the search box in the upper right corner. For your search, the Enterprise Console shows all matching objects on one PRTG core server. Click a monitoring object in the results to show it in the Enterprise Console's Devices 3038 tab.

Other objects, for example, manual sections, load in an external browser window.

When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's Options 3069 will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, please find more information in section SSL Certificate Warning 142.

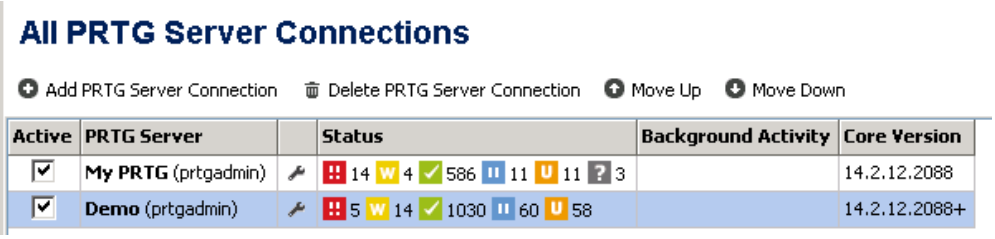
9.4 PRTG Servers

The Enterprise Console connects to the web server API running on every PRTG core server installation. It supports saving the configuration for a connection to one or more PRTG core servers. In a full PRTG installation, there is already a connection predefined.

For a successful connection, the program versions of Enterprise Console and PRTG core server have to match. When connecting to several servers, make sure they all run on the same software version. At least the third number of the whole version number has to be equal. For example, EC version 17.2.**31**.1917 can connect to server version 17.2.**31**.2018.

PRTG Servers List

From the main menu, select **File | Manage PRTG Server Connections** to view a list of all servers configured for the currently logged in Windows user account. You can also access this list by clicking the **PRTG Server Connections** entry above the device tree.



PRTG Servers List in the Enterprise Console

The list shows the server or display name, as well as login information used. In the **Status** column you see an overall sensor status for this server connection. You can also see if there is any **Background Activity** on the respective server (for example, a running Auto-Discovery 249), which can potentially affect performance and response times.

In the list, set a check mark for every PRTG server you want to poll with every update interval. If a server is not reachable, the Enterprise Console deactivates it automatically after several unsuccessful connection attempts. When opening the Enterprise Console, it automatically re-establishes the connection to all active servers.

Add or Edit a PRTG Server Connection

- Click **Add PRTG Server Connection** in the header bar above the server list to add a new server connection configuration.
- Click **Delete PRTG Server Connection** to remove an entry from the list.
- Click **Move Up** or **Move Down** to change the order of the servers on the Devices 3038 tab.

There is also a context menu 3079 available for each server connection with the following options.

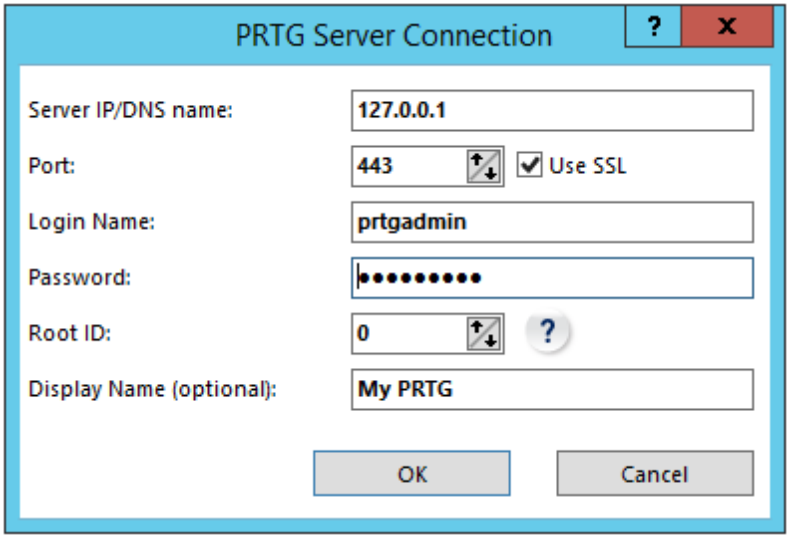
- Click **Deactivate PRTG Server Connection** to remove the server from the Devices 3038 tab but keep the server connection settings
- **Add** a server.

- Open and edit the **Settings** of the server.
- **Delete** the server.
- Open the server in the Ajax web interface (**Open in Web Browser**),
- **Move Up** and **Move Down** to change its position on the Devices 3038 tab.

To change the settings of an existing server in the list, open its context menu with right-click and click **Settings** or click the respective wrench symbol in the table. You can alternatively use the context menu of a server on the Devices 3038 tab. There you can choose between **Edit PRTG Server Connection** to open the edit dialog, **Deactivate PRTG Server Connection** to not show this server's monitoring data anymore (you can later reactivate it in the servers list 3062), or view Dependencies 126.

When adding or editing, a dialog box appears to enter connection information.

Connection settings are stored for each Windows user individually in the registry under the following node: HKEY_CURRENT_USER\Software\Paessler\PRTG Network Monitor\WinGUI



PRTG Server Connection Settings in Enterprise Console

Server IP/DNS name

- Enter the IP address or DNS name of the PRTG server the Enterprise Console connects to.
- This is the same address or name as defined in the web server settings for the core server. For detailed information please see PRTG Administration Tool 3136 (**Web Server**) section. Make sure the values match.
- Make sure the server is reachable (especially when using Network Address Translation (NAT)) and no firewall settings block the connection.

Port

- Enter the port on which the PRTG server runs.

- This is the same port as defined in the web server settings for the core server. For detailed information please see **PRTG Administration Tool** 3136 (**Web Server**) section. Make sure the values match.
- Make sure the server is reachable (especially when using Network Address Translation (NAT)) and no firewall settings block the connection.

Login Name

- Enter the login name that you use to login to the web server.
- This can be the administrator login or the login of another PRTG user.
- In a new installation, the login name is **prtgadmin** by default.
- For detailed information about user accounts, please see **System Administration—User Accounts** 2975 section.

Password

- Enter the password for the login name entered above.
- In a new installation, the password is **prtgadmin** by default.

Root ID

- Enter the ID of the object that is the root of the device tree 118.
- Default value is **0**, which is the **Root** group of your configuration.
- If you enter an other object's ID here, the device tree will start at this object, only showing all other objects below in the hierarchy.
- This is useful to only view a part of the device tree, which might load much faster.
- You can create several connections that only differ in the **Root ID** value to quickly switch between different views within your configuration, choosing different PRTG core server connections in the Enterprise Console's **Devices** 3038 tab.

Display Name (optional)

- Optionally enter a name that the EC displays in the **PRTG Server Connections** list.
- If you leave this field blank, the Enterprise Console displays the **Server IP/DNS name** setting there.

Click the **OK** button to save your settings or **Cancel** to discard them.

9.5 Options

From the Windows menu 3071 of the Enterprise Console, select **File | Options...** to open the options dialog.

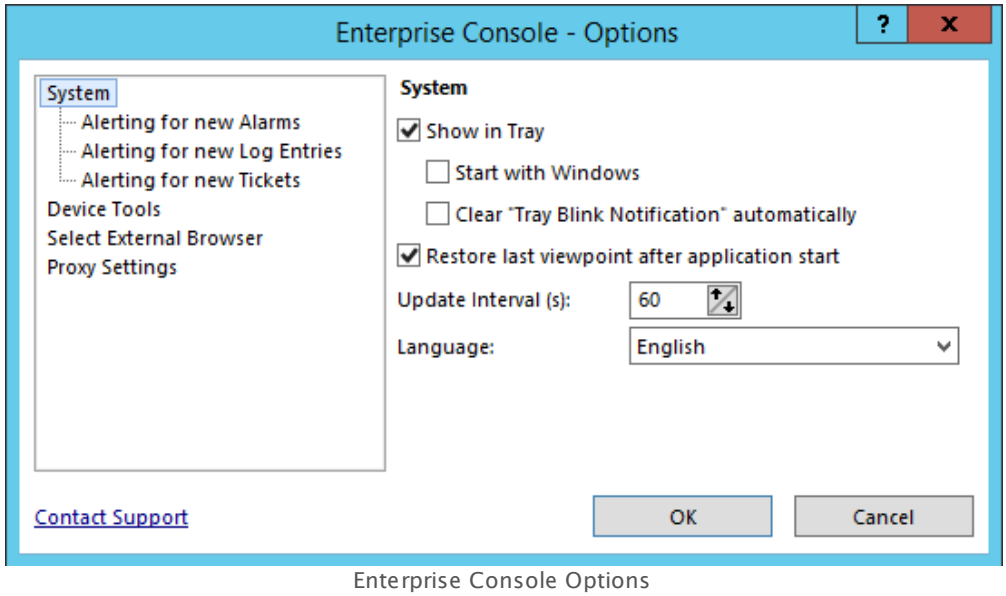
You can choose from these options on the left hand side:

- System 3065
- System—Alerting 3067
- Device Tools 3067
- Select External Browser 3069
- Proxy Settings 3070
- Contact Support 3022

System

From the Windows menu 3071 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

Change general system settings for the Enterprise Console.



Enterprise Console Options

ENTERPRISE CONSOLE – OPTIONS: SYSTEM

Show in Tray	By default this setting is enabled. With this setting enabled, a PRTG icon appears in the Windows tray 3031. When you point your mouse to it, it will show information with the most important status information about your monitoring. With a right-click you can access a menu with access to the most important functions. To use any alerting functionalities (see **System—Alerting** 3067 section), you must enable this option. If the tray icon is not shown, no alerting from the Enterprise Console is available.
Start with Windows	This setting is only available to change only if you enable the tray option above. By default this setting is enabled. With this setting enabled, the Enterprise Console will start up automatically when Windows starts.
Clear "Tray Blink Notification" automatically	This setting is only available to change only if you enable the tray option above. Whenever there are new entries in the **Alarms** 3049 list, the tray icon will start blinking. If you enable this option, the tray icon will stop blinking automatically as soon as there are no more alarms. With this option disabled, the icon will keep blinking, even if all alarms are cleared meanwhile.
Restore last viewpoint after application start	If this option is enabled, the Enterprise Console saves information about the currently shown view (for example, sensor details, a certain graph, or a map 2885). It is written to the registry 3070 when you close or exit the program. When you open the Enterprise Console again, it will try to restore the same view. Only if the object is not available any more (due to changes on the server, or due to unavailability of a server), the default view loads.
Update Interval (Sec.)	Define the number of seconds that the Enterprise Console waits before the screen refreshes. Please enter an integer value. Default value is **60** seconds. You can use the up and down arrows to go one second up or down.
Language	Choose the language for the Enterprise Console from the drop down menu. Default is **English**. Depending on your installation, you can choose other languages here. This setting only influences the language of the Enterprise Console.

System—Alerting

From the Windows menu 3071 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

You can define what the Enterprise Console will do in case of new **Alarms**, **Log Entries**, or **Tickets**. The settings are the same for all of these three cases, but you can individually define them for each case. On the left side, select either **Alerting for new Alarms**, **Alerting for new Log Entries**, or **Alerting for new Tickets** and define the settings as follows.

All alerting options only take effect if you enable the **Show in Tray** option in the system 3065 settings above. If the tray icon is disabled, there will be no alerting from the Enterprise Console.

ENTERPRISE CONSOLE – OPTIONS: ALERTING FOR NEW ALARMS

Blink Tray Icon	The tray icon will blink if there are new items to be alerted for. You can additionally set the **Clear Tray Blink Notification automatically** option in the system 3065 settings above.
Balloon Info in Tray	Show a balloon info next to the PRTG tray icon if there are new items to be alerted for.
Popup Message	Show a popup message window if there are new items to be alerted for. The popup window will be always on top until it is closed.
Play Sound	Play an audible notification if there are new items to be alerted for. There is a default sound defined. To change it, please click the folder icon and select any standard WAV file from your hard disk drive. PRTG already comes with a small set of sounds you can choose from. The sound file is only played on the computer running the Enterprise Console.
Open Enterprise Console	Open the Enterprise Console if there are new items to be alerted for.

Device Tools

From the Windows menu 3071 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

In the **Device Tools** settings you can define commands that will be available in the **Windows Menu** [3071] and context menu [3079] of groups, devices, and sensors. A command to initiate a remote desktop connection is already predefined.

You may need to run the Enterprise Console as administrator to make the tool function work with your Windows version.

Click the **Add** button to add a new command, or choose an existing one from the list and click the **Edit** button to change the settings. Use the **Delete** button to remove an entry from the list.

ENTERPRISE CONSOLE – OPTIONS: EDIT TOOL

Name	Enter a custom name for your command. The command will show up with this name in context menus. Please enter a string.
Command	Enter the command you want to execute on the local machine. This can be, for example the name of a program or script, with or without path, according to your system's configuration.
Parameters	Enter the parameters with which you want to execute the command. You can use the placeholders (variables) from section **Parameters—Available Placeholders** [3068]. Other placeholders are not possible. During runtime, these placeholders are replaced by the respective values set for the monitoring object you select to execute this device tool. For example, the %id placeholder will be replaced by the ID of a group, a device, or a sensor, depending on which object you execute the command for.
Shortcut	Select a key shortcut for the command. Choose an **F**-key from the list or select **None** to not use a key.

Parameters—Available Placeholders

The following placeholders (variables) are available in the Enterprise Console.

PLACEHOLDER	AVAILABLE FOR GROUPS	AVAILABLE FOR DEVICES	AVAILABLE FOR SENSORS	WILL BE RESOLVED TO
%id	☺	☺	☺	The object's **ID** as shown in the page header on the object's details page
%name	☺	☺	☺	The object's **Name**
%host	⊘	☺	☺	The sensor's or device's **IP Address/DNS Name**
%message	⊘	⊘	☺	The sensor's **Last Message**
%value	⊘	⊘	☺	The sensor's **Last Result** value
%type	⊘	⊘	☺	The sensor's **Type**

If you use a placeholder in combination with an object it is not available for, it will simply not be resolved but the placeholder itself will be returned.

To see the output of all placeholders for different objects you can create a simple test tool that displays the output in a command line window. Just create a tool with the command **cmd** and the following content in the **Parameters** field:

```
/K echo.id: %id && echo.name: %name
      && echo.host: %host && echo.message: %message
      && echo.value: %value && echo.type: %type
```

Right-click an object in the device tree and run the tool from the **Tools** option in the menu (either Windows 3071 or context menu 3075).

Select External Browser

From the Windows menu 3071 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

With these settings you can define which browser the Enterprise Console will use when you select a command that requires to open an external browser window, for example, when you select **View | Open in Web Browser** from the Windows menu of the EC. You can only select browsers installed on the system running the Enterprise Console, other browser options are disabled.

By default, the system's default browser is opened. To change the Enterprise Console's behavior, choose between:

- **Use system default browser (**browser.exe**)**
- **Use IE (Version:** x**)**
  Only Microsoft Internet Explorer 11 is supported by the Ajax web interface! Please do not use it with Internet Explorer 10 or earlier! We recommend that you use Google Chrome 57 or later (recommended) or Mozilla Firefox 52 or later as external browser.
- **Use Firefox (Version:** x**)**
- **Use Chrome (Version:** x**)**
- **Use Safari (Version:** x**)**

Proxy Settings

From the Windows menu 3071 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

If the connection to the PRTG core servers requires a proxy connection, you can set it here.

ENTERPRISE CONSOLE – OPTIONS: PROXY SETTINGS

No Proxy	Use a direct connection to the servers.
Use System Settings	Use your Windows default settings, configured in Internet Explorer. To view these settings, open the Internet Explorer on your system and select **Tools	Internet Options** from the menu. Select the **Connections** tab and click the **LAN settings** button.
Manual Proxy Configuration	Manually enter a proxy configuration. Enter the IP address or DNS name of the proxy, a port number, as well as username and password (if required by the proxy). Only basic authentication is available!

Settings Storage

For each individual Windows user account, the settings of the Enterprise Console are stored in the Windows registry.

For details, see section **Data Storage** 3226.

9.6 Windows Menu Structure

The Windows menu of the Enterprise Console has four main menu items:

- File 3071
- Edit 3072
- View 3076
- Help 3077

File

The **File** menu offers system related options for the Enterprise Console. The particular close and exit options depend on the enabling status of the tray option.

FILE	
Manage PRTG Server Connections	Show a list of all configured PRTG core server connections. For detailed instructions, see section **PRTG Servers** 3062 section.
Options...	Open the **Options** 3065 dialog to set EC system options and to configure one or more PRTG core server connections.
Close or Exit	This menu item appears as either **Close** or **Exit**, depending on whether the tray icon is enabled or disabled in the **Options** 3065 settings. ▪ Use **Close** to close the Enterprise Console window. Alerting is still available via the tray icon then. You can also double-click the tray icon to re-open the Enterprise Console. ▪ **Exit** shuts down the Enterprise Console completely. This option is only available if the tray icon is not running. Shortcut: Alt+X
Close and Exit	This menu item is only available if the **Show in Tray** option is enabled in the **Options** 3065 settings. It will completely shut down the Enterprise Console and tray icon, so no tray alerts are shown any more. Shortcut: Ctrl+Alt+X

Edit

The content of the **Edit** menu varies, depending on which menu tab [3037] you are and whether and which objects are selected within the **Devices** [3038], **Sensors** [3047], or **Alarms** [3049] tab.

Some of the options open the Ajax web interface when you select them.

When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's **Options** [3069] will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, please find more information in section **SSL Certificate Warning** [142].

EDIT

Check Now	Perform an immediate scan for all selected objects (use the Ctrl key to select multiple objects). This option polls all selected devices and queries new data for all sensors on them. If you choose this option for a probe or a group, you query data for all sensors in the object hierarchy [118] underneath. Shortcut: Ctrl+K
Details	Open the overview tab for the selected object (probe, group, device, or sensor).
Edit	Access the pages for editing **Settings...** [188], **Notifications** [188], **Access Rights...** [129], and **Management** [188] (not for sensors) of the selected object. In addition, you can **Rename...** this object. Point on it to see available options.
Dependencies	This option is only available if you select a server (the **Root** group), a probe, or group. This function shows an overview of the dependencies [126] configured for the selected object. If you select a dependencies option, the Enterprise Console opens the respective dependencies overview in a new window. For details, see section **Show Dependencies** [2822].
Add Group...	This option is only available if you select a probe or group (not the **Root** group). This option opens an assistant in a new window which guides you through adding a new group to the selected probe or group. For detailed instructions, see section **Add a Group** [268].
Add Auto-Discovery Group...	This option is only available if you select a probe or group (not the **Root** group). This option opens an assistant in a new window which guides you through adding such a group.

EDIT

For detailed instruction, see section **Auto-Discovery** 249.

Add Device...	This option is only available if you select a probe or group (not the **Root** group). This option opens an assistant in a new window which guides you through adding a new device to the selected probe or group. For detailed instructions, see section **Add a Device** 275.
Add Sensor...	This option is only available if you select a device. This option opens an assistant in a new window which guides you through adding a new sensor to the selected device. For detailed instructions, see section **Add a Sensor** 288.
Auto-Discovery	This option is only available if you select a device. Hover over it to see available options. You can choose between: ▪ **Run Auto-Discovery**: This option starts an automatic search and adds new sensors to the selected device. The search is running in background. You will see new sensors after a few minutes automatically. If you have set the option **Manual (no auto-discovery)** in the device settings section 362 **Sensor Management** and start the auto-discovery, PRTG will not run it. Please note that the Ajax web interface 222 behaves differently in this case. ▪ **Run Auto-Discovery with Template**: With this option you can run an auto-discovery with a pre-defined device template. For more information, see section **Auto-Discovery** 250 (**Run Auto-Discovery Now**).
Create Device Template...	This option is only available if you select a device. This option opens an assistant in a new window which guides you through creating a device template. This template is then available for auto-discovery 249. For detailed instructions, please see **Create Device Template** 2818.
Sort Alphabetically	This option is only available if you select a probe, a single group, or a device. This will sort direct children of the selected node such as groups, devices, or sensors in alphabetical order. The ordering is stored in the monitoring configuration so you cannot revoke it!
Acknowledge Alarm...	This option is only available if you select a sensor in a **Down** or **Down (Partial)** status 163. Point on it to see available options.

EDIT

For details on how to acknowledge an alarm, see section Alarms 3050.

Delete	Delete the selected object(s). You will be asked for confirmation before anything is actually deleted.
Clone...	This option is only available if you select a single group, device, or sensor. This options opens an assistant in a new window which guides you through cloning the selected object. For detailed instructions, see section Clone Object 2812.
Move	Move the selected object(s) of the device tree (use the Ctrl or Shift key to select multiple objects). Hover over it to see available options. Choose between **Top**, **Up**, **Down**, and **Bottom** to move the object(s) to the top or bottom of the mother node, or one entry up or down. You can also move the selected group or device to another group with **To Other Group...** This option opens an assistant in a new window to guide you through the movement. For details about allowed movements, see section Devices 3044.
Pause	Pause and resume monitoring for the selected objects from the device tree (use the Ctrl key to select multiple objects). Hover over it to see available options. Choose between: ▪ **Indefinitely** ▪ **Resume** ▪ **For 5 Minutes** ▪ **For 15 Minutes** ▪ **For 1 Hour** ▪ **For 3 Hours** ▪ **For 1 Day** ▪ **Pause Until...**: This option will open an assistant in a new window where you can enter a message and a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date.

EDIT

	You can also set up a **One-time maintenance window**: Enter a message and start and end date of the maintenance in the appearing window. Use the date time picker to enter the date and time.
Simulate Error Status	This option is only available if you select a sensor. Set the selected sensor to a simulated error status. As for the pause status, **Resume** will appear in the context menu if a the selected sensor is already in a simulated error state. **Simulate error status** does not work for sensors that run on a PRTG Mini Probe.
Priority/Favorite	Set the priority for the selected object. You can also add devices and sensors to favorites. For details, see section **Priority and Favorites** 211.
Historic Data	Open the historic data tab of the selected object. Hover over it to see available options. You can choose between **Last 2 days...**, **Last 30 days...**, and **Last 365 days...**, or when selected one sensor **Live Data...** and **View Historic Data...**. You can also create a report. For detailed instructions, please see **Historic Data Reports** 176 **(Menu)**. When you select one or more sensors (hold the Ctrl or Shift key to select multiple items), you can open the **Compare Sensors** 172 dialog. The graphs of all chosen sensors appear in the comparison dialog automatically. You can add additional sensors in the comparison dialog. For sensors, you can open the **Similar Sensors Overview** 180.
Device Tools	Call a tool command. All placeholders (variables) configured in a tool command will be resolved for the currently selected object. Hover over it to see all available tools configured in your **Options** 3067 settings (**Device Tools**). By default, a **Remote Desktop** tool is pre-configured that tries to initiate a remote desktop connection to the IP address or DNS name of the selected object. This will usually work for devices.

EDIT

	You can also add a device tool directly to the selected object: **Add Device Tool...** will open **Options—Device Tools** 3067. For devices, additional options are available. They allow you to connect to the **Service URL** value defined in the device's settings 3043, or open the **IP address/DNS name** of the device via the protocols HTTP, HTTPS, and FTP. For each of these functions, your system's default programs will be used. Usually, this is your browser. You can also install a remote probe on a device via **Remote Probe Quick Setup** 3199. You may need to run the Enterprise Console as administrator to make the tool function work with your Windows version.
Find Duplicates	This option is only available if you select a device. Search in your PRTG configuration for devices with the same IP address or DNS name as the selected device. A new window with the results will appear, either showing existing duplicates or a message indicating that there are no duplicates.
Drag & Drop Sorting	Enable this option to sort all objects in the device tree via drag and drop. By default, this option is disabled to avoid accidental moves of objects. For details, see section **Devices** 3044.
Send Link by Email	Send the link to the selected object by email. This option opens a new email using your system's standard email client. It contains a direct link to the details page of the selected object.
Open Ticket	Open a ticket that refers to the currently selected object. For details, please see section **Tickets** 3057.

View

The **View** menu provides settings related to what the Enterprise Console shows.

VIEW

Refresh	Query data for the current screen from the PRTG core server immediately, just as the automatic refresh does. You can configure the auto-refresh in the **Options** 3065 settings. Shortcut: F5

VIEW

Large Single Graph	Change the view in **Devices** 3038 menu tabs to large single graphs. This option displays live graphs and graphs for three other time spans in different tabs. Shortcut: Ctrl+L
Small Multiple Graphs	Change the view in **Devices** 3038 menu tab to multiple small graphs. This option displays live graphs and graphs for three other time spans in one tab.
Show Geo Maps	Choose if you want to show **Geo Maps** 2824 in the Enterprise Console. Shortcut: Ctrl+G
Show News Feed	Choose if you want to show the news feed in the Enterprise Console. Shortcut: Ctrl+N
Next Viewpoint	Go forward to the next viewpoint (only available if you went back to a previous viewpoint before). This is similar to a browser's function to go forth in history. Shortcut: Alt+Right
Previous Viewpoint	Go backwards to the previous viewpoint. This is similar to a browser's function to go back in history. Shortcut: Alt+Left
Open in Web Browser	Open the currently selected object in the Ajax web interface. This option is not available if multiple objects are selected. You can set the default browser in the **Options** 3069 settings.

Help

This menu provides links to help and information.

HELP

Help Center	Open the **Help and Support Center** in the Ajax web interface.

HELP

HTML Manual Enterprise Console...	Open the **Enterprise Console** 3028 sections of this manual in the Ajax web interface.
PRTG Network Monitor Homepage...	Open https://www.paessler.com/prtg in your browser for overall information about PRTG.
Follow & Share	Open PRTG's social network contact information in the Ajax web interface.
Contact Support	Open the **Contact Support** 3022 dialog box to leave feedback or to ask for support by sending a support bundle.
About...	Open an information window about the Enterprise Console application with version number and copyright information.

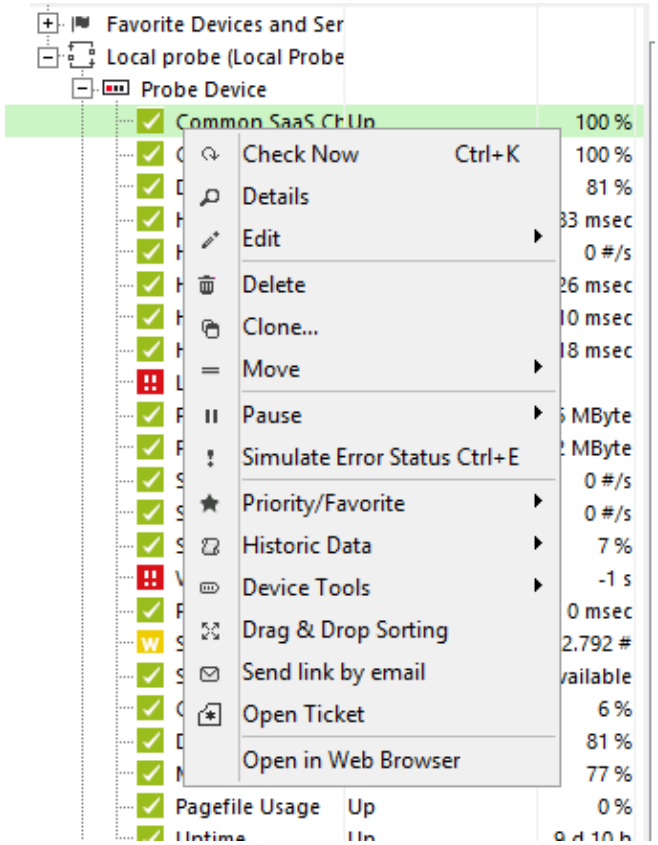
9.7 Context Menus

For every object in the Enterprise Console, there are context menus available which appear when you right-click an object in the device tree. These context menus vary depending on the selected object and always contain a sub-set of the options available in the Windows menu.

For detailed explanations, see section Windows Menu Structure 3071.



Context Menu of a Device in the Enterprise Console

9.8 Shortcuts Overview

The following shortcut keys are available in the Enterprise Console:

- **Alt+X**: File | Close or Exit
  With the **Show in Tray** option enabled in the **Options** 3065 settings, this is **Close**, otherwise **Exit**.
- **Ctrl+Alt+X**: File | Close and Exit
  This menu item is only shown if the **Show in Tray** option is enabled in the **Options** 3065 settings.
- **Alt+Right**: Next Viewpoint
- **Alt+Left**: Previous Viewpoint
- **Ctrl+K**: Edit | Check Now
- **Ctrl+P**: Edit | Pause | Indefinitely
- **Ctrl+R**: Edit | Pause | Resume
- **Ctrl+E**: Edit | Simulate Error Status
- **Ctrl+L**: View | Large Single Graph
- **Ctrl+S**: View | Small Multi Graphs
- **Ctrl+G**: View | Show Geo Maps
- **Ctrl+N**: View | Show News Feed
- **F5**: View | Refresh
- **F6**: [Context Menu] | Tools | Custom tool command, if available
- **F7**: [Context Menu] | Tools | Custom tool command, if available
- **F8**: [Context Menu] | Tools | Custom tool command, if available
- **F9**: [Context Menu] | Tools | Custom tool command (default: **Remote Desktop**)
- **F10**: [Context Menu] | Tools | Custom tool command, if available
- **F11**: [Context Menu] | Tools | Custom tool command, if available
- **F12**: [Context Menu] | Tools | Custom tool command, if available

PRTG Apps for Mobile Network Monitoring

10 PRTG Apps for Mobile Network Monitoring

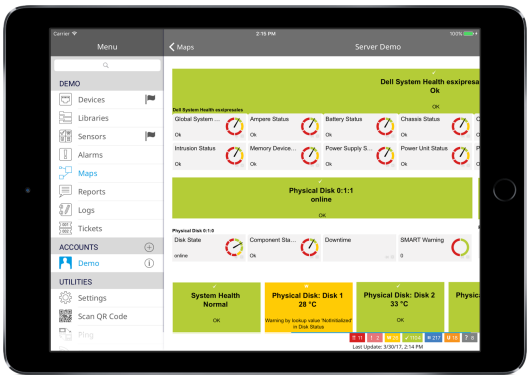
You can access your PRTG installation on your mobile devices with several PRTG apps. We provide apps for iOS devices, Android systems, and Windows Phone. You can download and use these apps for free. PRTG for iOS 3082, PRTG for Android 3082, and PRTG for Windows Phone 3083, and make it possible to monitor your network while on the go.

The basic requirements to use these free apps are a running PRTG core server which is accessible from the network your device is connected to (either directly or via a VPN connection) and a recent operating system version on your mobile device. For details about requirements, see below.

PRTG for iOS

PRTG for iOS is the iOS app for PRTG Network Monitor version 13 or later. You can use it on iPhone, iPad, and iPod touch with iOS version 8 or later. You can also use free push notifications 2923 with this app (required: PRTG for iOS 14.3.6 or later; PRTG 15.4.20 or later).

For more information and to download this app, see our website: **PRTG for iOS**.



Maps on iPad

PRTG for Android

PRTG for Android is the Android app for PRTG Network Monitor version 14 or later. Use it on your smartphone or tablet with Android version 4.0 or later, on a BlackBerry device or on a Kindle Fire. For full functionality, we recommend that you use at least Android 4.1. On your BlackBerry device you need version 10.3. You can also use free push notifications 2923 with the PRTG for Android app (required: PRTG for Android 14.3.2 or later; PRTG 15.4.20 or later).

For more information and to download this app, please see our website: **PRTG for Android**

You cannot deploy the app via BlackBerry Enterprise Service (BES).

Sensor List on PRTG for Android

PRTG for Windows Phone

PRTG for Windows Phone is the Windows Phone app for PRTG Network Monitor 13.3 or later. You can run it on Windows Phone 8.0 or later. You can also use free push notifications 2923 with the PRTG for Android app (required: PRTG for Windows Phone 15.1.1 or later; PRTG 15.4.20 or later).

For more information and in order to download this app, please see our website: **PRTG for Windows Phone**

Part 11

Sensor Technologies

11 Sensor Technologies

This section introduces different technologies that PRTG uses for monitoring to give you more background information. Please read more in the following sections.

Sensor Technologies—Topics

- Monitoring via SNMP 3087
- Monitoring via WMI 3092
- Monitoring via SSH 3095
- Monitoring Bandwidth via Packet Sniffing 3097
- Monitoring Bandwidth via Flows 3099
- Bandwidth Monitoring Comparison 3102
- Monitoring Quality of Service 3104
- Monitoring Email Round Trip 3109
- Monitoring Backups 3111
- Monitoring Virtual Environments 3112
- Monitoring Databases 3120
- Monitoring Syslogs and SNMP Traps 3125

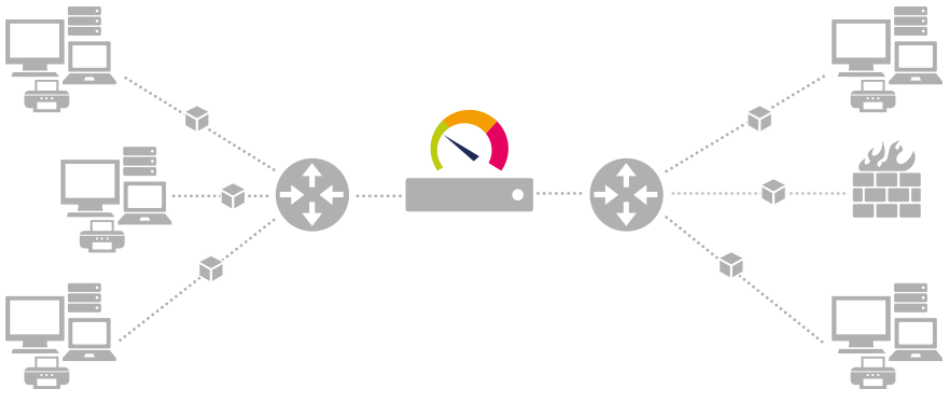
11.1 Monitoring via SNMP

Monitoring via Simple Network Management Protocol (SNMP) is the most basic method of gathering bandwidth and network usage data.

How SNMP Monitoring Works

SNMP is a set of standards for communication with devices in a TCP/IP network. SNMP monitoring is useful if you are responsible for servers and network devices such as hosts, routers, hubs, and switches. It enables you to keep an eye on network and bandwidth usage, and monitor important issues such as uptime and traffic levels.

You can use SNMP to monitor the bandwidth usage of routers and switches on a port-by-port basis, as well as device readings such as memory and CPU load. The target devices must support SNMP. Most devices with enabled SNMP require the same configuration like SNMP version and community string. To find out how to set up SNMP on a specific device, search in the internet for your device name or model and SNMP configuration. You will likely get plenty of information on how to configure SNMP.



Network Monitoring via SNMP

Click here to enlarge: http://media.paessler.com/prtg-screenshots/network-monitoring-via-snmp.png

When you use a sensor with this technology, PRTG sends small data packets to devices, for example, querying routers, switches, and servers for the traffic counters of each port. These queries trigger reply packets from the device. Compared to PRTG's other bandwidth monitoring technologies via flows, packet sniffing, or WMI, the SNMP option creates the least CPU and network load.

Reasons to Choose SNMP Monitoring

SNMP is the most commonly used method mainly because it is easy to set up and requires minimal bandwidth and CPU cycles. If your network devices support SNMP and/or if you want to monitor large networks with several hundred or thousands of sensors, we recommend that you start with SNMP.

Besides network usage monitoring, another well-known feature of SNMP is the ability to also watch other network parameters such as CPU load, disk usage, temperature, as well as monitoring many other readings, depending on the queried device.

SNMP Network Issues

To use Simple Network Management Protocol (SNMP) for monitoring purposes, it is imperative that UDP packets can travel from the machine running PRTG to the device you want to monitor and back. This is usually the case in LANs and intranets. For connections across the internet, to a Demilitarized Zone (DMZ), or for Wide Area Network (WAN) connections, some changes to the traversed firewalls may be necessary.

Keep in mind that SNMP V1 and V2c are not secure protocols so you should not use them across the internet or insecure data connections. Only SNMP version 3 supports encryption.

Understanding SNMP Sensors

To better understand and set up SNMP sensors, you may want to learn more about the principles of Object Identifiers (OID) and Management Information Base (MIB).

For more information about this topic, see this Knowledge Base article: How do SNMP, MIBs and OIDs work?

For an overview and details about all SNMP sensors, see section **List of Available Sensor Types** 387.

SNMP Versions

PRTG supports three versions of the SNMP protocol: Version 1, version 2c, and version 3.

SNMP Version 1

This is the oldest and most basic version of SNMP.

- Pro: Supported by most SNMP-compatible devices; simple to set up.
- Con: Limited security because it only uses a simple password (community string 3090) and sends data in clear text (unencrypted). Because of this, you should only use it inside LANs behind firewalls, but not in WANs. Version 1 only supports 32-bit counters which are not enough for high-load (gigabits/second) bandwidth monitoring.

SNMP Version 2c

This version adds 64-bit counters.

- Pro: Supports 64-bit counters to monitor bandwidth usage in networks with gigabits/second loads.
- Con: Limited security (same as with SNMP V1).

SNMP Version 3

This version adds authentication and encryption to SNMP.

- Pro: Offers user accounts and authentication for multiple users and optional data packet encryption, increasing available security; plus all advantages of Version 2c.
- Con: Difficult to configure and higher overhead for the probe, which will reduce the number of devices that you can monitor (see here 3089 for more information).

SNMP Traps

Various devices can send SNMP trap messages to notify you of system events.

- PRTG supports SNMP v1 and SNMP v2c traps.
- Destination for SNMP traps: IP address of the trap receiver, which is the IP of the PRTG probe system (server with either a local or remote probe running on it) to which you add the **SNMP Trap Receiver Sensor** 2143.

Which SNMP Version Should I Choose?

The SNMP version to choose depends on your environment, but as a guideline:

- If your network is publicly accessible, you may want to use SNMP v3, which has encryption and secure access. However security and encryption adds overhead, which results in less performance.
- If your network is isolated or well protected behind firewalls, the lower security of SNMP v1 or SNMP v2c may be sufficient.
- From the PRTG perspective, if you have a lot of devices to monitor, the SNMP v2c is preferable. It will allow you to monitor more devices on a shorter monitoring interval and supports 64-bit counters.

The most important thing is to set the same SNMP version in the PRTG settings (for example, on **Root** level) as you have configured in your target device. If you select an SNMP version that is not supported by the server or device you want to monitor, you receive an error message. Unfortunately, in most cases, these error messages do not explicitly point to the possibility that you use the incorrect SNMP version. These messages provide minimum information only, such as cannot connect or similar. Similar errors occur when community strings, usernames, or passwords do not match.

For basic requirements for SNMP monitoring, please see this Knowledge Base article: My SNMP sensors don't work. What can I do?

SNMP Overload and Limitations of the SNMP System

SNMP V1 and V2 scale directly with the performance of the hardware and the speed of the network. In our labs we are able to monitor 30,000 SNMP V1 sensors at a 60 second interval with one PRTG server (core and local probe) plus two remote probes with 10,000 sensors each.

However, SNMP V3 has performance limitations due to the SSL encryption. The main limiting factor is CPU power (as well as the other general limits for PRTG). Because of this limitation, you can monitor only a limited number of sensors per second using SNMP V3. Currently, PRTG is able to handle about 40 requests per second and computer core, depending on your system. This means that, on a common 1.x GHz computer with two cores, you can run about 5,000 SNMP v3 sensors with a 60 seconds scanning interval; on a system with four cores, you can monitor around 10,000 sensors with 60 seconds interval. The CPU load is at about 50% then. We do not recommend more.

Furthermore, the PRTG core server and probes should run on different computers. If you experience increased values in the Interval Delay SNMP or Open Requests channels of the **Probe Health Sensor** 1378 (values above 0 % indicate that the SNMP requests cannot be performed at the desired interval), you need to distribute the load over multiple probes. SNMP V1 and V2 do not have this limitation.

If you run into SNMP overload problems, you have three options:

- Increase the monitoring interval of the SNMP V3 sensors.
- Distribute the SNMP V3 sensors over two or more probes.
- Switch to SNMP V1 or V2 if you can go without encryption.

What is the SNMP Community String?

The SNMP Community String is similar to a user ID or password that allows access to the statistics of a router or another device. PRTG Network Monitor sends the community string along with all SNMP requests. If the correct community string is provided, the device responds with the requested information. If the community string is incorrect, the device simply discards the request and does not respond.

ⓘ SNMP community strings are only used by devices that support SNMP V1 and SNMP V2c protocols. SNMP V3 uses safer username/password authentication, along with an encryption key.

By convention, most SNMP V1/V2c equipment ships with a read-only community string set to the value **public**. It is standard practice for network managers to change all the community strings to customized values during device setup.

11.2 Monitoring via WMI

You can monitor Windows systems via Windows Management Instrumentation (WMI) 3092 and Windows Performance Counters 3092. WMI is the Microsoft base technology for monitoring and managing Windows based systems. PRTG uses this technology to access data of various Windows configuration parameters and status values. However, sensors using the WMI protocol generally have a high impact on system performance. In addition to strict WMI sensors, there are sensors that can use Performance Counters to monitor Windows systems.

To monitor via WMI and Performance Counters it is usually sufficient to provide **Credentials for Windows Systems** in PRTG. However, monitoring via WMI is not always trivial and often causes issues.

Please see this article in our Knowledge Base if you run into issues: My WMI sensors don't work. What can I do?

It is also possible to use Simple Network Management Protocol (SNMP) for Windows devices. The same information is often available using any of these protocols. From a performance perspective, the preference would be SNMP, and then WMI or Performance Counters.

How WMI Works

WMI allows accessing data of many Windows configuration parameters, as well as current system status values. Access can be local or remote via a network connection. WMI is based on COM and DCOM and is integrated in Windows versions as of Windows Server 2000. (add-ons are available for Windows 9x and NT4). PRTG officially supports WMI for Windows 7 or later.

To monitor remote machines, PRTG WMI sensors need Active Directory account credentials to have access to the WMI interface. You can enter these credentials in PRTG for the parent device or group, or in the **Root** 294 group. The sensor will then inherit these settings.

Sensors using the Windows Management Instrumentation (WMI) protocol generally have high impact on the system performance! Try to stay below 200 WMI sensors per probe 111. Above this number, please consider using multiple **Remote Probes** 3196 for load balancing.

For an overview and details about all WMI sensors, please see the **List of Available Sensor Types** 389 section.

Monitoring Windows Systems: Performance Counters

Besides sensor types that can monitor Windows systems only via WMI, PRTG provides sensor types that can use a hybrid approach. If you choose the hybrid approach, these sensors will first try to query data via Windows Performance Counters using Remote Registry Service. These Windows sensors use WMI as a fallback if Performance Counters are not available or cannot be read out. When running in fallback mode, PRTG re-tries to connect to Performance Counters after 24 hours. You can change the **Preferred Data Source** in the **Windows Compatibility Options** in the **Device Settings** 360.

You can identify these hybrid sensors by looking at their categories, for example, in the add sensor dialog. **Search directly** for "windows" and select "Performance Counters" as **Technology Used**. Among them are various sensors with "Windows" in the name, as well as some Hyper-V sensors.

Limitations of WMI on Windows Server 2008 (R1)

You should be aware that performance of WMI based monitoring is drastically limited when the monitoring station or the monitored client runs on Windows Server 2008 (R1). When it comes to network monitoring via WMI, Windows Server 2008 R2 is many times faster than Windows Server 2008 (R1).

These are not limitations of PRTG, but arise from the WMI functionality built into the Windows operating systems mentioned.

These limitations also apply to Windows Vista, which is no longer officially supported. You can still monitor machines running Windows Vista, but PRTG core server and probes are no longer supported on this operating system.

The results of our tests are:

- On Windows Server 2008 R2 or Windows 7 (and on later Windows versions) you can run most WMI sensors if you provide optimal conditions, such as running the core and the target systems exclusively under Windows Server 2008 R2 and being located within the same LAN segment. Actual performance can be significantly less depending on network topology and WMI health of the target systems—we have seen configurations that could not go beyond 500 sensors (and even less).
- On Windows 2008 (R1) you can run about 300 WMI sensors with one minute interval.
- The more Windows 2008/Windows 7 client systems you have in your network, the more WMI monitoring performance will be affected.
- System performance (CPU, memory etc.) of virtualization does not strongly affect WMI monitoring performance.

If you want to use WMI for network monitoring of more than 20 or 30 systems, please consider the following rules:

- Do not use Windows 2008 (R1) as monitoring stations for WMI-based network monitoring.
- If possible use Windows Server 2008 R2 for WMI based network monitoring (or later Windows versions).
- Consider setting up remote probes for the WMI monitoring. You still get far better WMI monitoring performance with a remote probe on a virtual machine running Windows Server 2008 R2 than on any bare metal system running Windows 2008)
- Consider switching to SNMP-based monitoring for large networks. Using SNMP you can easily monitor 10 times as many nodes as with WMI on the same hardware.

11.3 Monitoring via SSH

Monitoring via Secure Shell (SSH) enables you to gather performance and system data from many Linux and Unix distributions, as well as from certain Mac OS X systems. If your system is supported, this monitoring technology will work without any additional software on the target systems.

How Monitoring via SSH Works

To monitor remote machines via SSH, PRTG needs credentials (preferably root access) of the devices. If you use SSH sensors with PRTG, you can enter the necessary credentials in PRTG for the parent device or group, or in the **Root** 294 group, in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section on the **Settings** 188 tab. The sensors then inherit these settings by default.

With each scanning interval, PRTG logs in to your devices and queries data by executing specific commands.

For an overview and details about all SSH sensors, see the **List of Available Sensor Types** 390.

Limitations When Using SSH Monitoring

Due to the plurality of Linux/Unix derivatives, SSH sensors cannot support all distributions on the market. Also, only certain Mac OS systems are supported.

For a list of successfully tested distributions, see this Knowledge Base article: Which Linux or Mac OS distributions are supported by the Linux/Unix sensors (SSH, SNMP)?

Authentication via SSH Private Key

PRTG supports authentication via password or via private key.

When you use a private key, please ensure the following:

- Provide the key in OpenSSH RSA format.
- The key may not be encrypted! PRTG does not support password protected keys.
- The key must be provided as RSA key, you cannot use DSA keys with PRTG!

When you provide an unencrypted RSA private key in OpenSSH RSA format, please copy the entire key, including the

```
-----BEGIN RSA PRIVATE KEY-----
```

and

```
-----END RSA PRIVATE KEY-----
```

lines, into the designated text field in PRTG and **Save** your settings. Once you have pasted in and saved the private key, PRTG shows it as

```
**************************

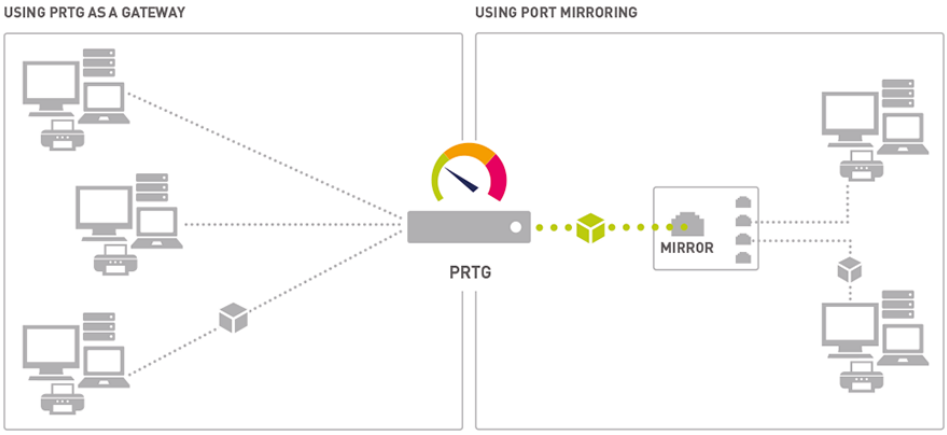
11.4 Monitoring Bandwidth via Packet Sniffing

Packet Sniffing comes into consideration if your network device(s) do not support SNMP or xFlow to measure bandwidth usage and if you need to differentiate the bandwidth usage by network protocol and/or IP addresses.

Packet Sniffer sensors support **Toplists** 2806 (Top Talkers, Top Connections, etc.).

How Packet Sniffing Works

If you need to know what applications or IP addresses cause the traffic in your network, you can use a packet sniffer. A packet sniffer looks at every single data package that travels through your network for accounting purposes.



Monitoring with PRTG via Packet Sniffer Sensors

Click here to enlarge: http://media.paessler.com/prtg-screenshots/data-acquisition-using-packet-sniffing-lan.png

PRTG can analyze the packets passing the network card of a PC or you can connect it to the monitoring port of a switch. To calculate bandwidth usage, PRTG inspects all network data packets either passing the PC's network card (shown on the left side in the schema above) or the data packages that a monitoring port of a switch (right side) sends with its built-in packet sniffer. Using remote probes, you can set up packet sniffers anywhere in your network (see **Add Remote Probe** 3195 section).

Comparing 3102 the four bandwidth monitoring technologies which PRTG provides (SNMP, WMI, xFlow, and packet sniffer) this one creates the most CPU and network load, so you should only use it in small to medium networks, on dedicated computers for larger networks or for individual computers.

Reasons to Choose Packet Sniffing

It is important to understand that the packet sniffer can only access and inspect data packages that actually flow through the network interface(s) of the machine running the PRTG probe software. This is fine if you only want to monitor the traffic of this machine (e.g., your web server). In switched networks, only the traffic for a specific machine is sent to each machine's network card, so PRTG can usually not discern the traffic of the other machines in the network.

If you also want to monitor the traffic of other devices in your network, you must use a switch that offers a monitoring port or port mirroring configuration (Cisco calls it SPAN). In this case, the switch sends a copy to the monitoring port of all data packages traveling through the switch. As soon as you connect one of the PRTG probe system's network cards to the switch's monitoring port, PRTG is able to analyze the complete traffic that passes through the switch.

Another option is to set up the PC running PRTG as the gateway for all other computers in the network.

Set Up Packet Sniffer Sensors

Find details on how to set up the different flow sensors in the following sections:

- **Packet Sniffer Sensor** 1278
- **Packet Sniffer (Custom) Sensor** 1289

Header Based Packet Sniffing

For packet sniffing, PRTG looks at the IP addresses and ports of source and destination to assess the protocol. This is a very fast method and saves system resources.

Sometimes, this method is not fully accurate. For example, it is not possible to identify HTTP traffic on ports other than 80, 8080 and 443 as HTTP. HTTP traffic on non-standard ports would not be accounted as such.

Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

- https://kb.paessler.com/en/topic/60203

11.5 Monitoring Bandwidth via Flows

Using flow protocols, you can monitor the bandwidth usage of all packets going through a device. In PRTG, you can view **Toplists** 2806 for all xFlow (NetFlow, IPFIX, sFlow, jFlow) sensors.

Flows are a type of monitoring data pushed from network devices to PRTG. You can use it to monitor where data is traveling from and to, and how much. This way it determines which machine, protocol, and user is consuming bandwidth. PRTG currently supports the following flow types:

- NetFlow v5/v9 and IPFIX: Originally introduced by Cisco and supported by several vendors
- jFlow: Traffic sampling technology introduced by Juniper networks
- sFlow: Short for sampled flow, introduced by HP. sFlow uses statistical sampling of the traffic at defined intervals to achieve scalability for high volume interfaces.

You can also use packet sniffing 3097 for bandwidth monitoring if your hardware does not support any of these flow versions.

How xFlow Monitoring works

You can measure bandwidth usage by IP address or by application in a network, using one of the xFlow (including IPFIX) protocols. They are the best choice especially for networks with high traffic (connections with 100s of megabit or gigabits).

For xFlow monitoring, the router gathers bandwidth usage data (flows), aggregates them, and sends information about these flows to PRTG using UDP packets. When you use sampling (mandatory for sFlow), only information about every n-th packet is sent to PRTG which reduces CPU load a lot. Because the switch already performs a pre-aggregation of traffic data, the flow of data to PRTG is much smaller than the monitored traffic. This makes xFlow the ideal option for high traffic networks that need to differentiate the bandwidth usage by network protocol and/or IP addresses.

NetFlow and IPFIX Monitoring

The NetFlow (and IPFIX) protocol is mainly used by Cisco devices. Once configured, the router sends for each data flow a NetFlow or IPFIX packet to the monitoring system running on a PRTG probe. You can be filter and evaluate the data in PRTG. There are different NetFlow and IPFIX sensors available: The basic ones offer predefined channel definitions, the custom variants enable you to define your own channels.

The advantage of using NetFlow or IPFIX:

- Generates little CPU load on the router itself (according to Cisco 10,000 active flows create about 7% additional CPU load; 45,000 active flows account for about 20% additional CPU load).
- Generates less CPU load on the PRTG core system, compared to packet sniffer sensors.

You must enable NetFlow or IPFIX export on the device you want to monitor. The device must send a flow data stream to the IP address of the PRTG probe system on which you set up the NetFlow or IPFIX sensor.

You can monitor Juniper **jFlow** with the corresponding sensors as well. Basically they are adjusted NetFlow v5 sensors.

sFlow Monitoring

sFlow works similar to NetFlow monitoring. The router sends data flow packets to the monitoring system running on a PRTG probe. The most obvious difference between the two flow protocols: With sFlow, not all of the traffic is analyzed, but only every n-th packet. It is like having a river of traffic and you take a cup of water out of it ever so often and analyze it.

The advantage is clear: There is less data to analyze, there is less CPU load needed, and less monitoring traffic is generated. Nevertheless, you can get a good insight into your network bandwidth usage.

PRTG supports sFlow version 5.

Set Up Flow Sensors

Find details on how to set up the different flow sensors in the following sections:

- NetFlow V5 Sensor 1207
- NetFlow V5 (Custom) Sensor 1219
- NetFlow V9 Sensor 1230
- NetFlow V9 (Custom) Sensor 1242
- IPFIX Sensor 1063
- IPFIX (Custom) Sensor 1075
- sFlow Sensor 1457
- sFlow (Custom) Sensor 1469
- jFlow V5 Sensor 1095
- jFlow V5 (Custom) Sensor 1107

Limitations

On a powerful 2008 PC (Dual Core, 2.5 Ghz), you can process about 100,000 flows per second for one xFlow stream. Using sampling, the number of actual flows can be much higher. When using complex filters, the value can be much lower. For example, with a router sending about 2,000 flows/second (which corresponds to mixed traffic at gigabit/second level without sampling) you can expect to configure up to 50 NetFlow sensors operating properly.

PRTG internally monitors its own NetFlow processing. You can see decreased values in the **Health** channels of the Core Health 602 and Probe Health 1378 sensors as soon as NetFlow packets are not processed due to an overload (you find these sensors on the local probe device).

If you experience an overload, please consider using sampling or setting up multiple probes and distribute the NetFlow streams to them. We recommend that you do not add more than 50 NetFlow sensors per PRTG probe.

This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

Flow sensors are not IPv6 compatible.

11.6 Bandwidth Monitoring Comparison

The following table shows the differences between PRTG's four methods available for bandwidth monitoring:

	WMI 3092	SNMP 3087	Packet Sniffer 3097	xFlow (IPFIX, NetFlow, sFlow, jFlow) 3099
Setup	Medium	Easy	Easy to complex (depending on filter rules used)	Can be complex (e.g., the switch must be configured)
Traffic can be filtered	No	No	Yes	Yes
Differentiate bandwidth usage by protocol or IPs	No	No	Yes	Yes
PRTG can show Toplists (Top Talker, Top Connections, Top Protocols, custom)	No	No	Yes	Yes
Filter bandwidth usage by IP	No	No	Yes	Yes
Filter bandwidth usage by MAC address	No	No	Yes	No
Filter bandwidth usage by physical network port	Yes	Yes	No	No

	WMI 3092	SNMP 3087	Packet Sniffer 3097	xFlow (IPFIX, NetFlow, sFlow, jFlow) 3099
Monitor network parameters other than bandwidth usage	Yes	Yes	No	No
CPU load on the machine running PRTG	Low	Low	Higher, depends on the amount of traffic	Higher, depends on the amount of traffic
Excess bandwidth usage of monitoring	Small	Small	None (except when monitoring switch ports are used)	Depends on the traffic

11.7 Monitoring Quality of Service and VoIP

PRTG can monitor the Quality of Service (QoS) in a network with dedicated QoS sensors, as well as Cisco IP Service Level Agreement (SLA) and Cisco Class Based Quality of Service (CBQoS). Slight variations of network parameters like jitter, packet loss, or packet delay variation (PDV) usually have only little effect on TCP based services (for example, HTTP, SMTP). But for UDP based services like Voice over IP (VoIP) and video streaming, a steady stream of data packets is crucial. The sound quality of a VoIP call drops dramatically when UDP packets are not received in a timely fashion, or if packets are lost or out-of-order.

As a rule of thumb for good quality of service (in a VoIP perspective), you want low measurements for jitter (less than 20 to 50 ms) and PDV (less than 100 ms), and preferably zero measurements for packet loss, duplicated packets, or packets in wrong order.

For Quality of Service measurements, four sensor types are available:

- **QoS (Quality of Service) Sensor** 1395
  Monitors VoIP relevant network parameters by testing network connection quality between two probes.
- **QoS (Quality of Service) Round Trip Sensor** 1403
  Monitors VoIP relevant network parameters by testing network connection quality between a probe and a target device at the endpoint of the connection. Traffic is measured bidirectional.
- **Cisco IP SLA Sensor** 540
  Monitors VoIP relevant network parameters through IP SLA results from Cisco devices (via SNMP).
- **SNMP Cisco CBQoS Sensor** 1587
  Monitors VoIP relevant network parameters by using Cisco's CBQoS (via SNMP).

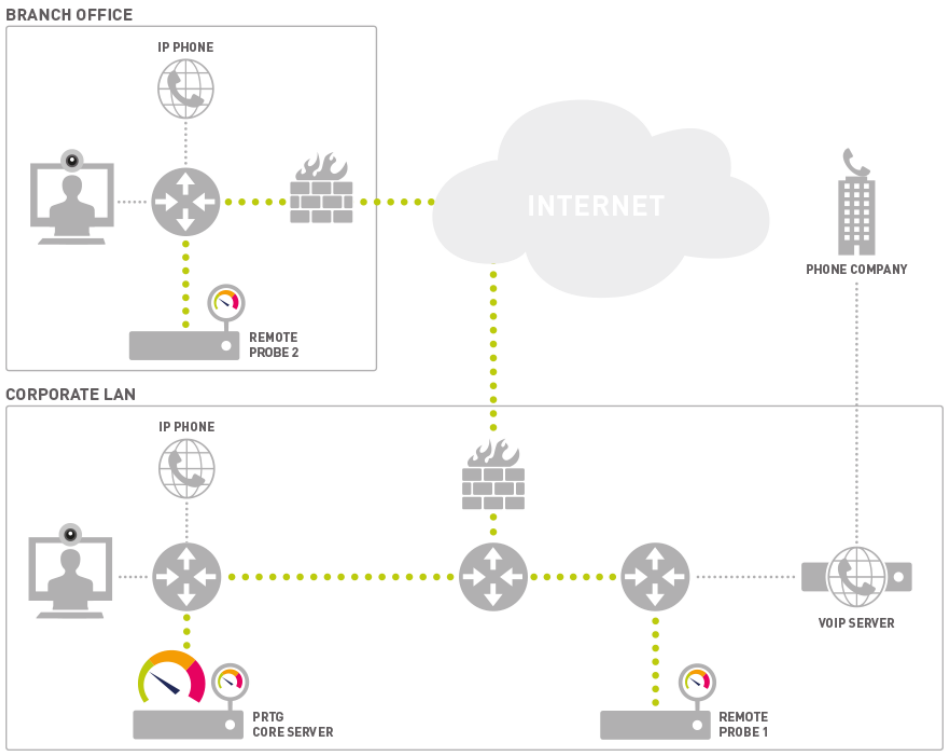
QoS (Quality of Service) Sensors

The QoS Sensors monitor the quality of a network connection by measuring the following parameters:

- Jitter in ms according to RFC 3550
- Packet delay variation (PDV) in ms according to RFC 3393
- Lost packets in %
- Out-of-order packets in %
- Duplicated packets in %

The QoS sensors measure quality of service by sending UDP packets between two probes. This means that you can test any network connection in your network by simply placing a remote probe 3195 on (or near) each 'end' of the connection and measuring the connection quality between them. This is the perfect tool to find network issues that can affect VoIP sound quality or video streaming 'hiccups'.

You can use the QoS Round Trip sensor also without installing a remote probe at the connection endpoint. See this Knowledge Base article for details about the PRTG QoS Reflector: How can I monitor QoS roundtrips without using remote probes?



Monitoring Quality of Service with PRTG

Click here to enlarge: http://media.paessler.com/prtg-screenshots/voip-monitoring-1.png

The measurements for QoS monitoring are taken between two probes. So the first step is to place two PCs running a remote probe on (or near) both ends of the connection that you want to monitor. As an alternative, the local probe on the PC running the PRTG core can also be used as one end, or you can use the PRTG QoS Reflector (see the Knowledge Base) to bounce the packets when monitoring QoS roundtrips. If any firewalls, packet filters, or Network Address Translation (NAT) systems are en route, you must configure them as necessary so that the UDP packets can reach the target probe.

In PRTG, create a new QoS sensor on a **Probe Device**, or, if you use the roundtrip sensor, on any device. With the settings for number and for size of the packets, you can configure the test data stream. 1,000 packets of 172 bytes each is a good start, but if your applications use larger packets you may want to enter other values here. Try to configure the test streams with parameters similar to that of the UDP services you are using across this connection.

Find details about settings in the manual sections **QoS (Quality of Service) One Way Sensor** 1395 and **QoS (Quality of Service) Round Trip Sensor** 1403.

Cisco IP SLA Sensor

Wikipedia describes IP SLA as a feature included in the Cisco IOS Software that can allow administrators the ability to Analyze IP Service Levels for IP applications and services. IP SLA uses active traffic-monitoring technology to monitor continuous traffic on the network. This is a reliable method in measuring over head network performance. IP-SLA is mostly used to monitor the sound quality of VoIP traffic.

If you have not done so already, add a device in PRTG for the Cisco device that you want to monitor. Then create a new **Cisco IP SLA** sensor on this device.

Find details about settings in the **Cisco IP SLA Sensor** 540 section.

This feature is only available in the more expensive Cisco devices. If you do not have IP SLA capable routers and switches, you can still get similar information with PRTG QoS sensors (see above 3104) that do not require any special hardware—just two PCs running Windows. If you own hardware that supports IP SLA, then PRTG brings you probably the least-cost monitoring solution for IP SLA. Most vendors charge extra for IP SLA support (a thousand bucks and more). Following Paessler's long term policy, we simply include this as one of our sensor types. With PRTG you can even use the PRTG on premises Freeware Edition to monitor IP SLA!

PRTG monitors the following parameters: Calculated Planning Impairment Factor (ICPIF), Mean Opinion Score (MOS), Average Jitter, Packets Lost, Packets Out Of Sequence, Packets Late, Average Round Trip Time (RTT), DNS RTT, TCP RTT, Transaction RTT.

Especially two of these parameters are interesting for VoIP: Mean Opinion Score (MOS) and Calculated Planning Impairment Factor (ICPIF).

SNMP Cisco CBQoS Sensor

Cisco Class Based Quality of Service (CBQoS) provides information about QoS of Cisco network devices which support the Modular QoS command line interface (MQC). With Classed Based QoS, you can obtain monitoring data that includes summary counts and rates by traffic class before and after the enforcement of QoS policies, according to Cisco's CBQoS Management Information Base (MIB) definition.

PRTG determines CBQoS data via Simple Network Management Protocol (SNMP). The corresponding sensor type is available out-of-the-box in PRTG version 13.x.5 or later. CBQoS is available in Cisco IOS by default as of version 12.4(4)T.

To monitor CBQoS, add a device to PRTG for the Cisco device that you want to monitor. Then create a new SNMP Cisco CBQoS sensor on this device.

See section **SNMP Cisco CBQoS Sensor** 1587 for more details.

This sensor type supports the following CBQoS classes:

- **Class Map**: statistical data about class maps, such as pre- and post-policy packets and sizes, drop packets and size, as well as no-buffer drop packets

- **Match Statement**: statistical data about match statement specific information, such as pre-policy packets and size
- **Queueing**: statistical data about queuing actions, such as current and maximum queue depth, drop packets, and drop size

You can select the desired CBQoS entries which you want to monitor while creating the sensor in PRTG. The available entries are given with their particular connections, their descriptions, and class types.

Voice over IP

For Mean Opinion Score (MOS) measurements, Cisco conducted a panel test where a wide range of listeners judged the quality of voice samples sent using particular codecs, on a scale of 1 (poor quality) to 5 (excellent quality). The Cisco device calculates the corresponding value for the current network connection based on the network parameter measurements like jitter and packet loss.

The Cisco IP SLA sensor reads out the MOS directly from the Cisco device. For the QoS and the QoS Round Trip sensor, PRTG calculates the MOS by itself. For details, see this Knowledge Base article: How does PRTG calculate the MOS score for QoS sensors?

The values and their meanings are:

MOS	Quality	Expected Quality Impairment
5	Excellent	Imperceptible
4	Good	Perceptible, but not annoying
3	Fair	Slightly annoying
2	Poor	Annoying
1	Bad	Very annoying

The second interesting parameter ICPIF is the sum of measured impairment factors minus a user-defined access Advantage Factor that is intended to represent the user's expectations, based on how the call was placed (for example, a mobile call versus a land-line call) (quoted from Cisco's website).

Upper Limit for ICPIF	VoIP Call Communication Quality
5	Very good

Upper Limit for ICPIF	VoIP Call Communication Quality
10	Good
20	Adequate
30	Limiting case
45	Exceptional limiting case
55	Customers likely to react strongly (complaints, change of network operator)

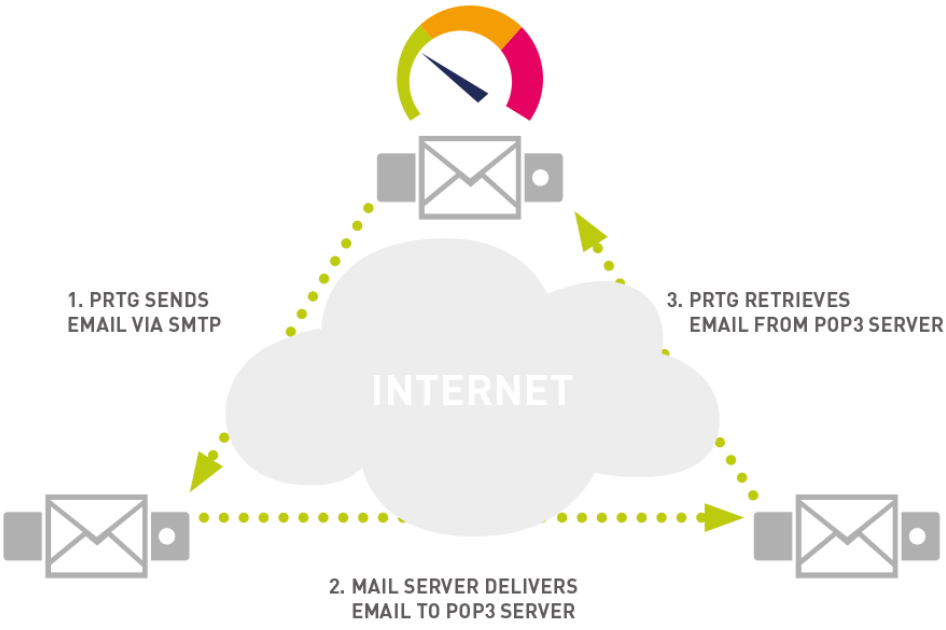
11.8 Monitoring Email Round Trip

Email Round Trip sensors ensure the end-to-end delivery of emails and make it possible to monitor availability and performance of a complete email delivery process. There are two sensor types for this task:

- SMTP&POP3 Round Trip Sensor 1519
- SMTP&IMAP Round Trip Sensor 1508

Both initially deliver an email to a mail server using SMTP. Afterwards the receiving mailbox is scanned using Post Office Protocol version 3 (POP3) or Internet Message Access Protocol (IMAP) until the email arrives. The test email contains a unique code in the topic which is used to identify the email, such as PRTG Roundtrip Mail: {6D136420-5A3E-46CF-871A-1DAF0C4F3D5D}

When PRTG successfully received an email in this email round trip cycle, it marks the respective message for deletion on the mail server. Usually, a mail server will then delete this email. For best performance, we recommend using a dedicated email accounts for email round trip sensors.



Monitoring an Email Round Trip

Click here to enlarge: http://media.paessler.com/prtg-screenshots/monitoring-an-email-round-trip.png

In the scenario shown above, there are three steps in the round trip:

- **Step 1**
  PRTG delivers an email via the SMTP protocol to a mail server (just like an email client).
- **Step 2**
  The SMTP server delivers the email to a POP3/IMAP server (which can be located at a remote site, in your local LAN or on the same server as well).

- **Step 3**
  Every few seconds PRTG connects to the POP3/IMAP server until the test email arrives.

Recommended Configuration

Here is a simple concept to check delivery of email out of and into your organization:

1. Create a dedicated email account for this test in your mail system.
2. Set up an external email account (hosted mail server, free mail service, etc.) and configure it to send all emails back to this dedicated email account in your organization (which you created in Step 1).
3. Set up a PRTG round trip sensor to send an email to the external email account (which you created in Step 2) using your network's mail server and then check for the email account on your mail system (which you created in Step 1) for arrival of the email.

With this technique you are testing multiple aspects of your email server setup. As long as the sensor shows a green light, this means:

- Your email server accepts emails via SMTP.
- Emails are being sent to the outside world (internet connection works, MX lookups work etc.).
- Emails from external mail server can be delivered into your mail system (this includes aspects like the fact that the MX records for your domain are correct, your mail server can be reached from the outside world, your email filtering is working etc.).
- Emails can be retrieved using POP3 (or IMAP).

Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.

Conclusion

These two sensor types are a great tool to ensure delivery of email from and to your mail servers. Compared to the standard SMTP, POP3, and IMAP sensors, which only check the availability of these services, the two roundtrip sensor types actually monitor the complete transaction from accepting the email on the first email server to delivery of the email on the final POP3/IMAP server.

11.9 Monitoring Backups

Monitoring your backup software enables you to be sure that your recent backups succeeded. With PRTG you can check the email notifications of various backup jobs. You only need two things for backup monitoring:

1. Configure your backup software to send emails to a dedicated email account.
2. Configure the PRTG **IMAP Sensor** for backup monitoring.

PRTG will analyze the backup emails for you and set the status of the IMAP sensor accordingly. This way you will see the states of all your backup jobs at a glance.

Backup Monitoring via Email

11.10 Monitoring Virtual Environments

A highly flexible IT infrastructure is a common need nowadays and virtualization has become an important pillar of the IT all over the world. Applications in your network might be distributed over many different servers, networks, and locations. They might also be in the cloud, and your computations can take place in data centers spread over the whole world. So, if your network connection or any other corresponding hardware fails, hundreds of applications might be unavailable—an impact to your daily business processes which should be avoided at any costs.

Because of this, monitoring the physical infrastructure of your data center is still a must in times of virtual environments. With the layer of virtualization in addition to your physical equipment, your logical infrastructure also needs a close treatment. PRTG assists you to deal with these advanced requirements and enables you to react proactively to issues before they affect your whole system. With PRTG you can monitor all layers of your IT infrastructure in a comprehensible way so you will reduce issues related to dynamic IT environments significantly.

Monitoring All Layers of Your IT Infrastructure

In general, you can assume that with the layer of virtualization you have to monitor a total of four layers in your IT infrastructure:

- **Hardware (Server Racks):** Usually you will set up your monitoring in the common way and monitor most of the hardware components in your network with PRTG's SNMP sensors 387. You are able to gain monitoring data about many different device readings such as CPU load, memory, disk space with this monitoring technology 3087, as well as information about network traffic and bandwidth usage of your routers and switches. It is absolutely mandatory for a working IT environment to monitor all hardware components in order to be alerted if something fails or hardware resources are running out. In addition, you can identify potential bottlenecks affecting your virtualized infrastructure. You can set this monitoring up in the usual way.

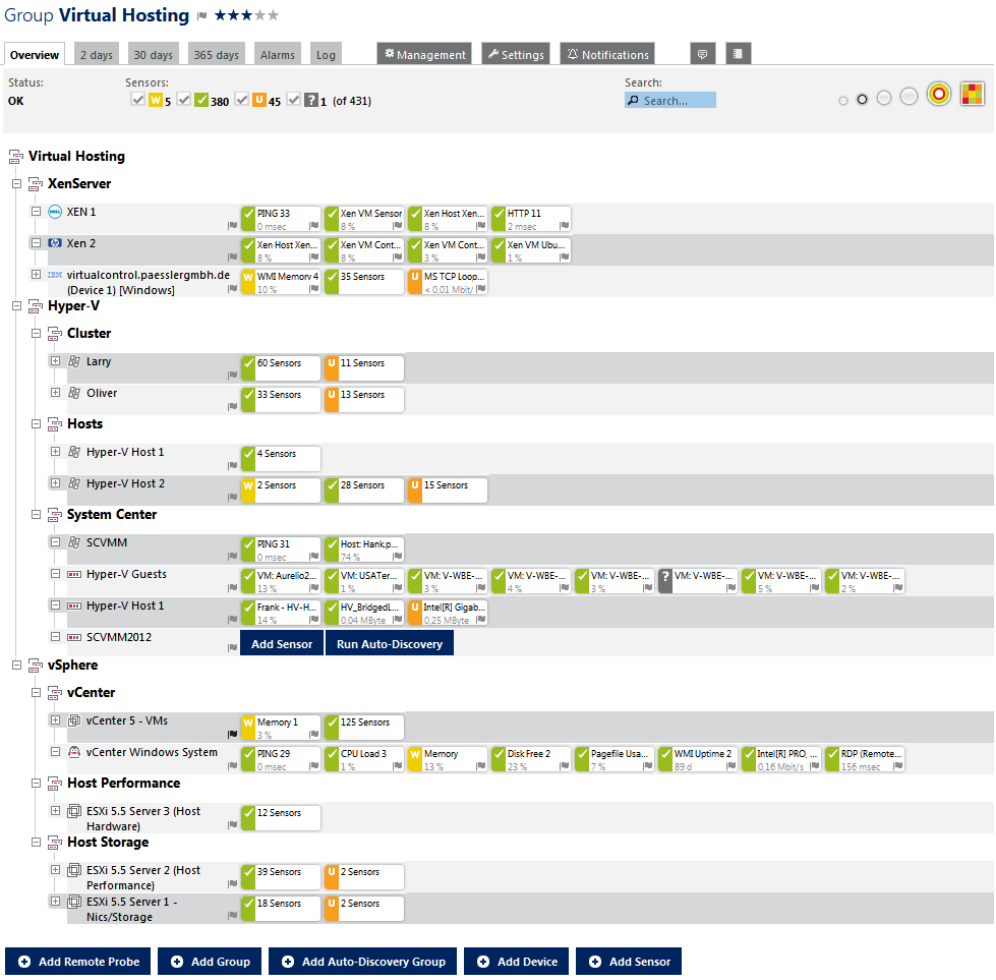
- **Host Server Hardware:** It is essential to explicitly monitor the host hardware of your virtualization solution. If you have issues with your virtual machines (VMs), the origin might be a host hardware failure. You should closely monitor your VM host servers to get alerted if the status is other than "normal". Besides the out of the box hardware sensors, PRTG provides specific sensors for various virtualization host servers; the following monitoring data of your host servers will help you prevent issues in virtualized environments:
  - VMware: current reading and health status (via WBEM), a general status as shown in vSphere (via SOAP), and disk space of a VMware data store (via SOAP)
  - Hyper-V: host health critical values, deposited pages, network traffic, CPU usage of guests, hypervisor, and in total
  - Citrix XenServer: CPU, memory, and network usage, the number of running virtual machines on the host server, and load average

- **VMs from the "Outside":** The virtual machines run on their particular host servers. PRTG can show you the status of single virtual machines and several of their performance counters. It might be helpful to know which resources a single VM uses and needs, but monitoring single VMs is not advisable in every case because it has a noticeable influence on the overall performance. Often it will be sufficient to monitor only VMs which are critical for your network. If a VM reaches its capacity limits, PRTG can alert you and you can conduct the corresponding resolution steps like enhancing this VM's resources. Indicators for a healthy virtual machine which you can monitor with PRTG out of the box are:
  - VMware: CPU and memory usage, disk read and write speed, read and write latency, and network usage
  - Hyper-V: CPU usage, disk read and write speed
  - Citrix XenServer: CPU usage and free memory

- **VMs from the "Inside" (Operating Systems):** You can monitor the Windows operating system of a single VM with PRTG's standard WMI sensors 389, for example. With this technology 3092 you can access data of various Windows parameters. Other operating systems like Linux/MacOS can make data available via SSH 3095 and SNMP 3087. The status of the operating systems on your VMs can indicate potential issues of the same, just like the operating systems on your physical machines which are important for a reliably working IT infrastructure: You can monitor these with the same attention, depending on your application scenario, but be careful due to performance considerations. Especially many WMI sensors can result in load problems, so monitor only really important systems "from the inside". Furthermore, you do not need to monitor every item multiple times. For example, it might be sufficient to monitor free disk space only from the outside of the actual VM.

Monitoring the Virtual Infrastructure

To monitor your IT infrastructure, best practice is to set up the monitoring of the hardware layer of your data center first in PRTG, especially in order to find potential bottlenecks which might have an impact on your virtual servers. Then you can start monitoring your virtual environment itself. If you use several solutions for virtual hosting, it is also a good idea to group related host servers, their virtual machines, and the operating systems together. The screenshot below will give you an idea about how to organize this.



Grouped Virtual Components

The screenshot above shows you the particular group "Virtual Hosting" of an entire PRTG setup. This is an example how monitoring of virtual environments can look like. The sample group contains several subgroups for the virtualization solutions Citrix "XenServer", Microsoft "Hyper-V", and VMware "vSphere". The vSphere group, for example, has three subgroups: we monitor the vCenter VMs and the vCenter Windows system, the performance of the host server, and the storage system of the host.

Devices for Physical Hosts

In PRTG, set up devices which represent the physical hosts of your virtual machines. For example, for your VMware hosts, add devices which represent the ESXi servers, for Hyper-V add devices which represent your Hyper-V host servers, for Citrix add devices which represent your Xen servers.

Then you can add suitable and expressive sensors to the host server devices. Running PRTG's auto-discovery [249], many useful sensors will be created automatically. There are several pre-configured host hardware sensors available out of the box in PRTG:

- VMware Host Hardware (WBEM) Sensor 2354: monitors an ESXi server via Web-Based Enterprise Management (WBEM)
- VMware Host Hardware Status (SOAP) Sensor 2362: monitors a VMware host server via Simple Object Access Protocol (SOAP)
- VMware Host Performance (SOAP) Sensor 2372: monitors a VMware host server via Simple Object Access Protocol (SOAP)
- Hyper-V Host Sensor 1001: monitors via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device
- Citrix XenServer Host Sensor 550: monitors via Hypertext Transfer Protocol (HTTP)

These sensor types monitor hardware specific counters to ensure that no hardware issues affect your actual virtual machines. Additional sensor types can monitor the host hardware via SNMP (for example, traffic and custom requests), data storage on ESXi servers via SOAP, as well as there are sensors for network adapters and storage devices which are connected to a Hyper-V host server. You can also monitor Virtuozzo host servers with sensors for network usage and disk space for each container.

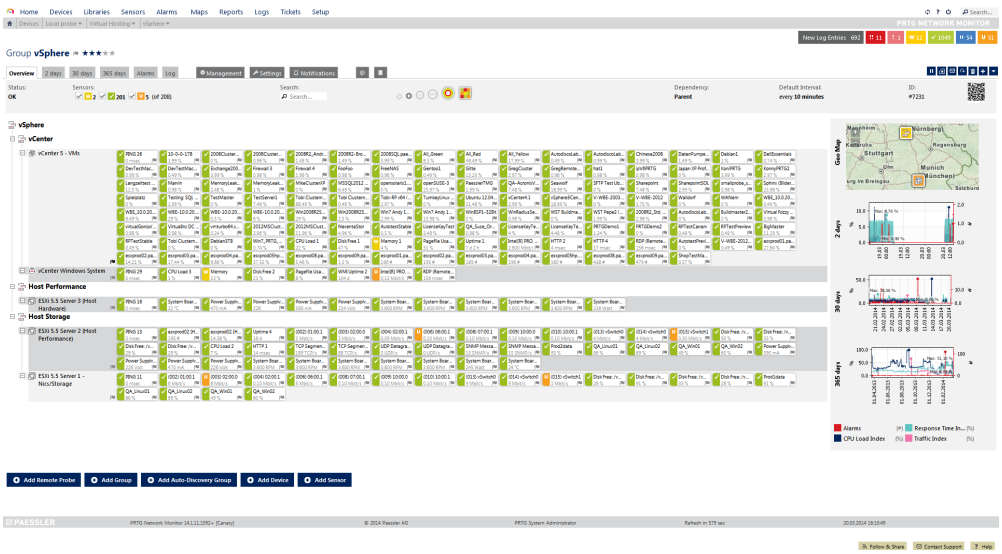
Devices for Virtual Machines

To monitor your actual virtual machines, add them to your host servers in PRTG. For a better overview, you might want to add another device to PRTG which represents your host server and add sensors for your VM to there. The according sensors for virtual machines will show you the performance of single VMs as well as their usage of resources. This will help you identify VMs with poor performance and react proactively before one or more VMs crash. As mentioned above, you can additionally monitor your particular VMs from the inside (which means the operating systems on your VMs) if necessary. See the sections below for details about particular virtualization solutions.

VMware Virtual Machine

PRTG's VMware Virtual Machine (SOAP) Sensor 2382 monitors VMs on a VMware host server via Simple Object Access Protocol (SOAP). With the VMware system, the general idea is to add a vCenter server as a device to PRTG and use the vCenter as parent device where you add the sensors to for your virtual machines. So, in the case of vMotion when your VMs change their host server, PRTG will be able to follow these movements and will never lose the monitored VMs.

For this sensor type, you need the Microsoft .NET Framework with the latest update of version 4.0 running on the probe machine. If you use many VMware sensors, we also recommend adjusting the settings on your VMware host server to accept more incoming connections.

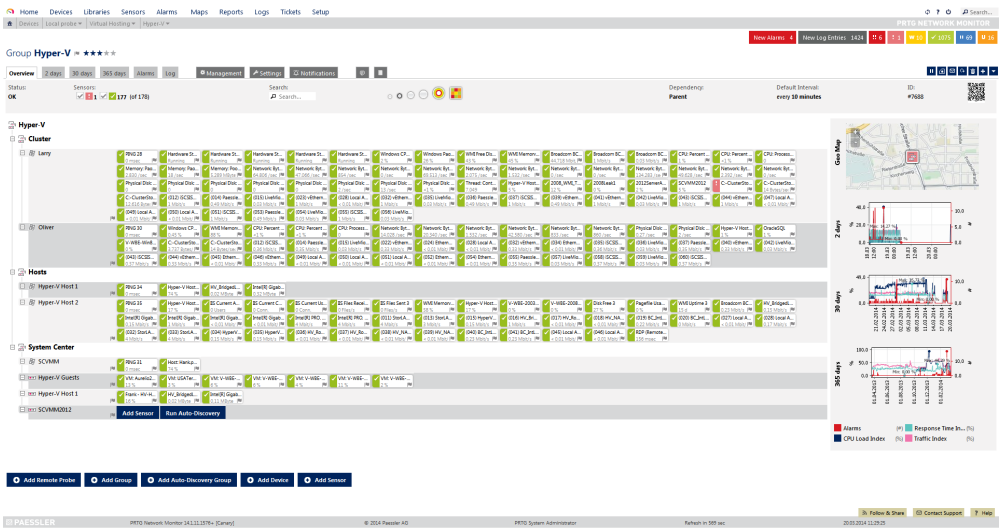


vSphere Group

This screenshot a sample vSphere group in PRTG. As recommended, the VMware virtual machines are added to the vCenter device. There is also a dedicated device for the vCenter Windows operating system with common WMI sensors for CPU, memory, disk, and network usage. The ESXi host servers are organized in their own groups regarding performance and storage. In this example, PRTG monitors the hosts with the standard SNMP hardware sensors as well as with the specific VMware ESXi host sensors.

Microsoft Hyper-V Virtual Machine

PRTG's Hyper-V Virtual Machine Sensor 1009 monitors VMs via Windows Management Instrumentation (WMI) or Windows Performance Counters, as configured in the "Windows Compatibility Options" of the parent device. With this hybrid approach, the sensor first tries to query data via performance counters and uses WMI as a fallback if there are no performance counters available. Performance counters in general need less system resources than WMI. We recommend using System Center Virtual Machine Manager (SCVMM) as parent device for this sensor type, because when your VMs change their physical host with Live Migration, this sensor will still be able to continue monitoring. You should also disable User Account Control (UAC) in the Windows operating system of the VM.



Hyper-V Group

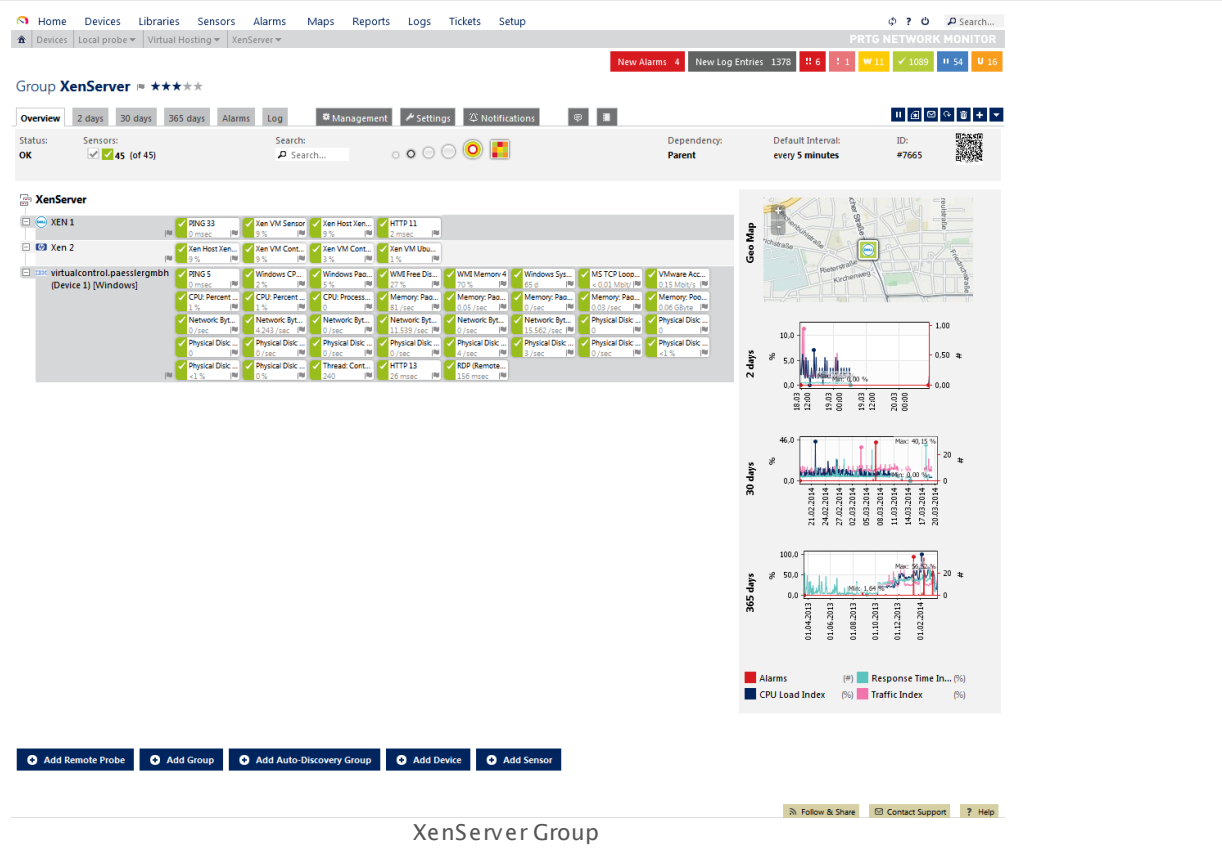
This screenshot shows a sample Hyper-V group in PRTG. There is a dedicated group for failover clustering where two nodes are monitored with several SNMP and WMI sensors, as well as Hyper-V Host Server sensors 1001 and sensors for the Hyper-V virtual machines. This ensures that Hyper-V and failover clustering works without any issues. The Hyper-V hosts are monitored the same way, organized in a dedicated group for hosts.

Note that we recommend adding the particular virtual machines to the SCVMM server if possible! We pointed out above that you should add the VMs to an SCVMM server to avoid issues with Live Migration. You can see this in the group "System Center". The particular VMs are added to the dedicated device "Hyper-V Guests".

Citrix XenServer Virtual Machine

PRTG's Citrix XenServer Virtual Machine Sensor 561 monitors VMs via Hypertext Transfer Protocol (HTTP). For this sensor type, you have to add a device to PRTG which represents a Citrix XenServer with version 5.0 or later. Another requirement is the Microsoft .NET Framework: You have to run the latest update of version 4.0 on the probe machine where you add this sensor to.

In a XenServer pool, every host knows each running VM. Because of this, there is no central instance which provides all available data so it does not matter on which host you query your VMs. All queries on any host are automatically forwarded to the pool master which manages the XenServer pool. So it is sufficient to create the desired sensors for your XenServer VMs on a device that represents one host server of your pool. PRTG's XenServer sensors can figure out by themselves which host is running and retrieve the according data.



XenServer Group

This screenshot shows a sample XenServer group in PRTG. There are two devices for XenServer hosts (Xen 1 and Xen 2), each with a Citrix XenServer Host sensor [550] and several Citrix XenServer Virtual Machine sensors [561] for the particular VMs on this host. Furthermore, the Windows operating system is represented as a dedicated device ("virtualcontrol") which is monitored with several WMI sensors regrading CPU, disk, memory, and network usage.

Conclusion

The sensor types described in this section monitor virtual machine specific counters to ensure that all your VMs have enough resources available. If a VM is overloaded, PRTG can notify you immediately and you can proactively take care of issues before a particular VM has an outage or other failures. Additionally, we have shown an idea for a structured virtual monitoring with several recommendations.

You can find all available sensors for virtual servers and the according virtual machines in section List of Available Sensor Types—Virtual Servers Sensors [391].

Performance Considerations

For best performance when monitoring virtual environments, we strongly recommend that you use a computer with **Windows Server 2012 R2** to run the PRTG probe with the according sensors. So for example, you can run up to 300 VMware sensors in a 60 seconds scanning interval on Windows 2012 R2, while you can only use 30 VMware sensors with the same interval on Windows 2008 R2.

11.11 Monitoring Databases

Monitoring your databases enables you to ensure that, on the one hand, database queries are processed in time, and, on the other hand, that the database itself performs within the defined parameters. Furthermore, database monitoring with PRTG makes it possible to be alerted via a corresponding sensor status if database queries return an unexpected result value.

PRTG comes with built-in native sensors for the most common databases:

- Microsoft SQL servers
- MySQL servers
- PostgreSQL servers
- Oracle SQL servers

It is also possible to monitor many other database servers. For this concern, PRTG uses the ActiveX Data Objects (ADO) interface.

There are two types of database sensors:

- **Sensors monitoring databases directly** 3120: Monitor databases from the user perspective. These sensors send a request to the database server and receive corresponding values. You can optionally process data tables and show values in individual channels or monitor transactions.
- **Sensors monitoring database performance** 3123: Monitor databases with a more abstract view on the servers. Usually, these sensors monitor performance counters via Windows Management Instrumentation (WMI).

Sensors Monitoring Databases Directly

PRTG provides several sensors which can "look into" the content of databases. Sensors of this type connect to the database server, execute a defined query, and show the execution time of the whole request and the query. You can use these sensors to process the data table and show requested values in individual channels.

The following sensor types are available for this kind of monitoring:

- **Microsoft SQL v2 Sensor** 1135: Monitor your Microsoft SQL server 2005 or later.
- **MySQL v2 Sensor** 1151: Monitor your MySQL server version 5.0 or later.
- **Oracle SQL v2 Sensor** 1253: Monitor your Oracle database server version 10.2 or later.
- **PostgreSQL Sensor** 1363: Monitor your PostgreSQL database version 7.x or later.

For these sensor types, you can define valid SQL statements that the sensors send to the database server. Define the queries in an SQL script file and store it into the respective **\Custom Sensors\sql** subfolder of your PRTG installation (see section **Data Storage** 3226 for details).

You can select this SQL script when you add the sensor to PRTG. With every scanning interval [307], the sensor executes this script with the defined query against the database and the database returns corresponding values in individual channels (see the example [3121] below for sample channel value selections). Use the **Sensor Channels Settings** [2783] to define limits for specific values.

These sensor types need .NET 4.0 or later installed on the computer running the PRTG probe.

Alternatively, you can monitor almost all available database servers with the **ADO SQL v2 Sensor** [418] via an ActiveX Data Objects (ADO) connection.

Example: SQL Channel Value Selection

The SQL (v2) sensors determine their channel values by using column numbers, column names, row numbers, or key value pairs. This section shows which option you can choose to get the desired value from an SQL data table.

Consider the following data table that an SQL query might return from a database:

article_id	articles_available	first_listing	orders
00	12	2001	4
01	345	2005	56
02	678	2008	290
03	90	2012	32

This data table has four columns with the following numbering:

- Column 0 has the name "article_id"
- Column 1 has the name "articles_available"
- Column 2 has the name "first_listing"
- Column 3 has the name "orders"

The numbering of columns starts with 0, as well as the numbering for rows starts with 0. The table has four rows, each row contains the properties of one "article". The "articles" have the IDs 00, 01, 02, 03. This also illustrates the proper row numbering (0, 1, 2, 3).

With the options for channel value selection in SQL sensors, you can read out the following values:

- All values that are in row 0 (here: 00, 12, 2001, 4)
- All values that are in column 0 (here: 00, 01, 02, 03)

- All values that are in column 1 (here: 12, 345, 678, 90)

It is not possible to get values from any other cell in a data table. If you need this, you have to re-construct your data table.

The following samples show possible results for channel value selections regarding this data table:

SAMPLE CHANNEL VALUE SELECTIONS

Channel Value Selection by Column Number	This channel will show the value in row 0 of the column you specify. Consider you define "1" as column number. Then the sensor channel value is "12" because it is the cell in column 1 and row 0. Possible return values for this option are: ▪ Column number "0" returns "00" ▪ Column number "1" returns "12" ▪ Column number "2" returns "2001" ▪ Column number "3" returns "4"
Channel Value Selection by Column Name	This channel will show the value in row 0 of the column you specify. Consider you define "orders" as column name. Then the channel value is "4" because it is the cell in column "orders" and row 0. Possible return values for this option are: ▪ Column name "article_id" returns "00" ▪ Column name "articles_available" returns "12" ▪ Column name "first_listing" returns "2001" ▪ Column name "orders" returns "4"
Channel Value Selection by Row Number	This channel will show the value in column 0 of the row you specify. Consider you define "1" as row number. Then the sensor channel value is "01" because it is the cell in row 1 and column 0. Possible return values for this option are: ▪ Row number "0" returns "00" ▪ Row number "1" returns "01" ▪ Row number "2" returns "02" ▪ Row number "3" returns "03"

SAMPLE CHANNEL VALUE SELECTIONS

Channel Value Selection by Key Value Pair	This channel will show the value in column 1 of the same row where the key in column 0 was found. Consider you define "02" as key. Then the sensor channel value is "678" because it is the cell in the same row in column 1 as the the key in column 0. Possible return values for this option are: ▪ Key "00" returns "12" ▪ Key "01" returns "345" ▪ Key "02" returns "678" ▪ Key "03" returns "90"

This sample channel value selection illustrates how to choose the correct option to get needed values from an SQL data table and shows which cells the SQL sensors can address.

UDF: Counting Returned Rows

If you execute a UDF (User Defined Function) on the SQL server and want to know how many rows this UDF returns, follow these steps:

- A command to execute your UDF on the SQL server may look like this, for example:

```
exec myUDF
```

- To get the information how many rows this UDF returns, extend the query in your SQL script:

```
exec myUDF;
select @@rowcount as row_count
```

- Create a new SQL v2 sensor and enable **Data Processing** while sensor creation.
- In the settings of your SQL sensor, choose the option **Select Channel Value by Column name**
- Enter **row_count** into the **Column Name** field of the channel to show the value from this column in the channel.
- To count table rows returned by a SELECT statement, choose the option **Count table rows** in the sensor settings section **Data Processing**.

Sensors Monitoring Database Performance

Performance sensors for database servers have a more "abstract" view on databases and regard performance "from the outside". They do not read out any values of the database, neither do they send SQL queries to databases. This sensor type is only available for Microsoft SQL.

The Microsoft SQL server sensors monitor performance via Windows Management Instrumentation (WMI). You can manually set up different performance counters for your server instances, for example, general statistics, access methods, buffer and memory manager, locks, and SQL statistics.

Microsoft SQL Server performance sensors are available for Microsoft SQL Server 2008, 2012, 2014, and 2016:

- **WMI Microsoft SQL Server 2008 Sensor** 2628
- **WMI Microsoft SQL Server 2012 Sensor** 2640
- **WMI Microsoft SQL Server 2014 Sensor** 2652
- **WMI Microsoft SQL Server 2016 Sensor** 2664

11.12 Monitoring Syslogs and SNMP Traps

PRTG is utilizable as a full scale syslog server and SNMP trap receiver. Every PRTG installation includes this functionality so no additional software is needed. This manual section describes a sample configuration for PRTG's syslog and SNMP trap receiver and gives you an idea about how to use these features.

Syslog is a well-established standard for computer message logging. Many network devices support sending syslogs to communicate informational, analysis, and debugging messages that are intended for network management and security auditing. SNMP traps are asynchronous notifications from SNMP-enabled devices and can be used to report important incidents and data, just like syslog messages. Devices trigger these messages for various reasons, such as system events, outages, critical conditions, and many more.

PRTG provides two dedicated sensor types that work as full scale syslog and SNMP trap receivers:

- **SNMP Trap Receiver Sensor** 2143
- **Syslog Receiver Sensor** 2309

Because both the syslog and the trap receiver are implemented as common sensor types, you do not need to install software in addition to PRTG (for example, you do not need an extra syslog server but only the PRTG web server). You can create the Syslog Receiver as well as the SNMP Trap Receiver sensors in the usual PRTG way via the add sensor 288 dialog. Then configure your syslog or SNMP trap-enabled device(s) to send messages to PRTG.

Under lab conditions, PRTG could handle about 10,000 syslog and trap messages per second on a quad core desktop machine when using a single sensor without filters.

The number of messages PRTG can process actually depends on your configuration and system setup. It might be significantly fewer messages.

You can filter the incoming messages by various parameters so that PRTG will process only specific messages and purge other data right away. Processed messages are stored in an internal high-performance database on the particular probe machine and are available for review and analysis via the PRTG web interface. The main limiting factor for storing syslog and trap messages is the hard disk space on the machine running the PRTG probe with these sensors.

Sample Configuration

Follow the steps below for a sample configuration of Syslog and SNMP Trap Receiver sensors. You can apply these instructions to both the SNMP Trap Receiver as well as the Syslog Receiver because the setup works in a similar way for both.

1. Adding the Receivers 3126
2. Configure the Source Devices 3127
3. Collect Messages 3127
4. Review and Analyze Messages 3128

5. Refine the Filters 3129

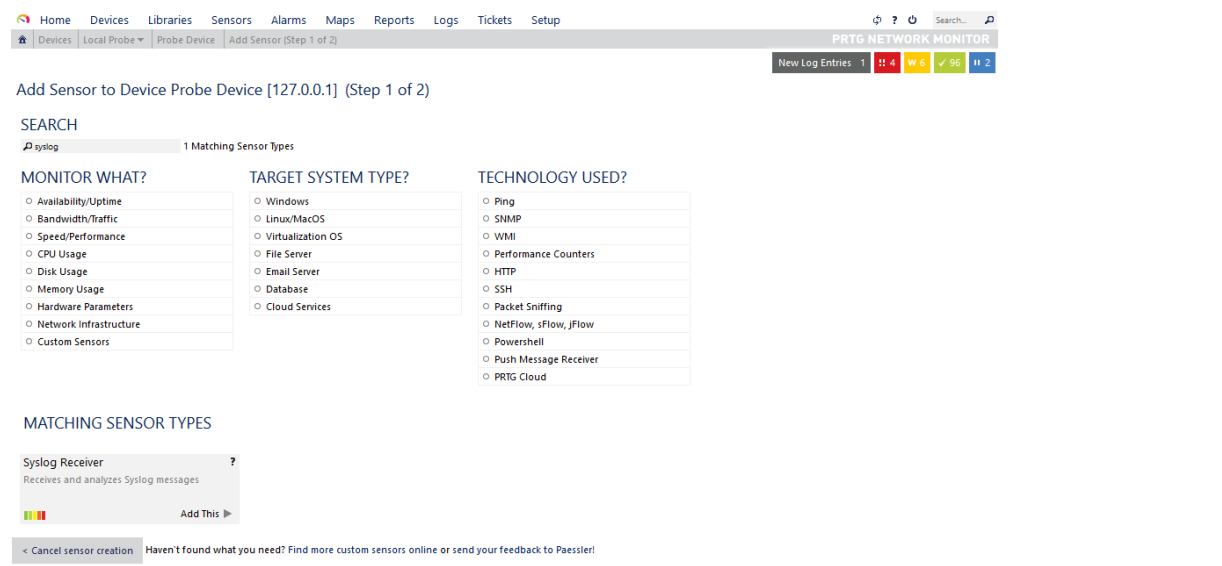
6. Create Notification Triggers 3130

Step 1: Add a Syslog Receiver or SNMP Trap Receiver sensor to PRTG.
Both sensor types inherit an implicit filter from the IP address of the parent device. So, on the one hand, it is possible to add these sensors to a probe device 120. Then you will receive all messages from the system running the probe and can optionally filter for specific sources later. On the other hand, you can add these sensors directly to the source device. Then only messages from this device will be processed.

Add the receiver sensors to the desired device in the common way, for example, via the device's context menu 222. We recommend leaving the sensor's default settings unchanged for the first configuration (port, include and exclude filter, warning and error filter) to see what data actually comes in.

Adding the sensor to a network device directly will increase its speed in comparison to a filter definition in the sensor settings. Distributing Syslog and SNMP Trap Receiver sensors over different probes will make the overall performance scalable and gives you flexibility with the data storage 3226 location.

If you do not add the sensor to a probe device but to another device in PRTG, be careful with the configuration: Ensure that the IP address or DNS name of the parent device matches the proper sender. For example, if you want to receive syslog or trap messages from a Storage Area Network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.

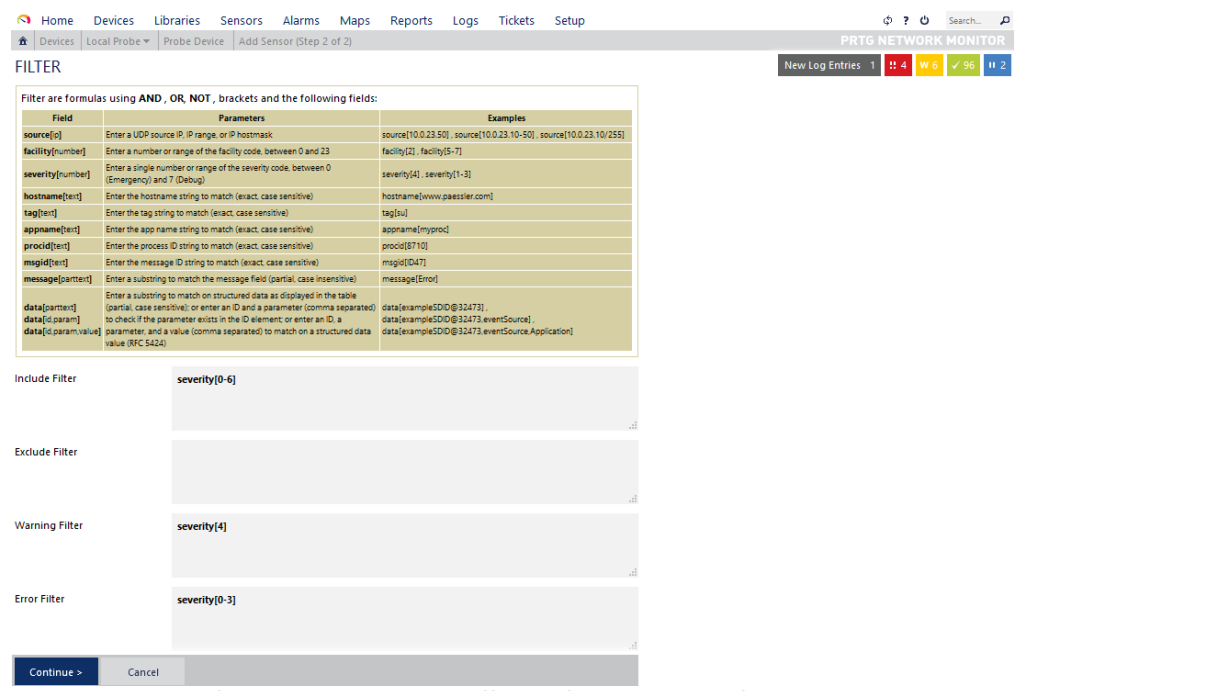


Syslog Receiver Sensor in the Add Sensor Dialog

Step 2: Configure your network device(s) that support sending syslogs or SNMP traps appropriately.
Configure your syslog or SNMP trap ready devices to send syslogs or traps (see the documentation of the respective device vendors). They have to address the PRTG probe where your Syslog or SNMP Trap Receiver sensor runs. So specify the IP address of the machine with the respective PRTG probe. If you keep your syslog or trap receiver's default settings, use the port 514.

The protocol is User Datagram Protocol (UDP).

The SNMP Trap Receiver does not support **SNMP v3** traps. Please use SNMP v1 or v2c instead.

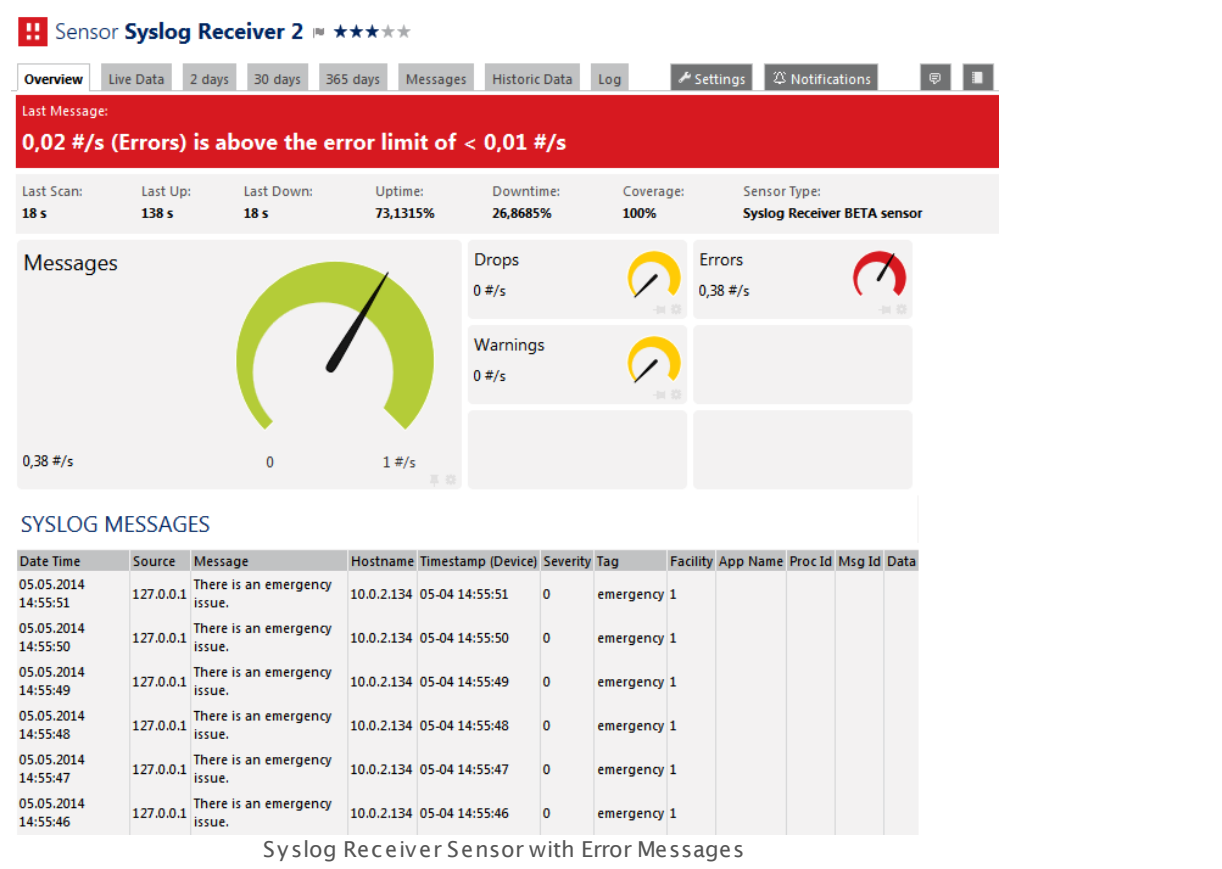


Default Sensor Settings: Sufficient for the First Configuration

Step 3: Start collecting syslog or SNMP trap messages from your devices.
You do not have to complete any further configuration steps to use PRTG as a syslog server or SNMP trap receiver. When your device(s) send syslogs or SNMP traps to the specified PRTG probe machine, the messages appear automatically in the PRTG web interface. After each sensor scan (by default, the scanning interval is inherited from the parent device), PRTG will count the received syslogs or traps in the according channels (total number of messages during the last interval, error and warning messages, or dropped packets).

Let the syslog receiver or the SNMP trap receiver collect data for a while to see what comes in. By default, the respective sensor will go into a **Warning** status if there was at least one message with severity 4 and into an **Error** status if there was at least one message with severity 3 or lower during the last sensor scan.

Incoming messages are counted per scanning interval, so it might take a few moments to see the received syslogs and traps, depending on the remaining time until the next sensor scan. Of course, you can use **Check Now** via the sensor's context buttons [155] to perform an immediate scan and see corresponding data. The sensor states are also defined per scan. So, for example, a message that is classified as an error will count for the error channel only for one scanning interval. If there is no new error message in the following scanning interval, no message is shown in the error channel and the error status will disappear after the next sensor scan. The syslog or trap itself will still be accessible on the **Messages** tab.

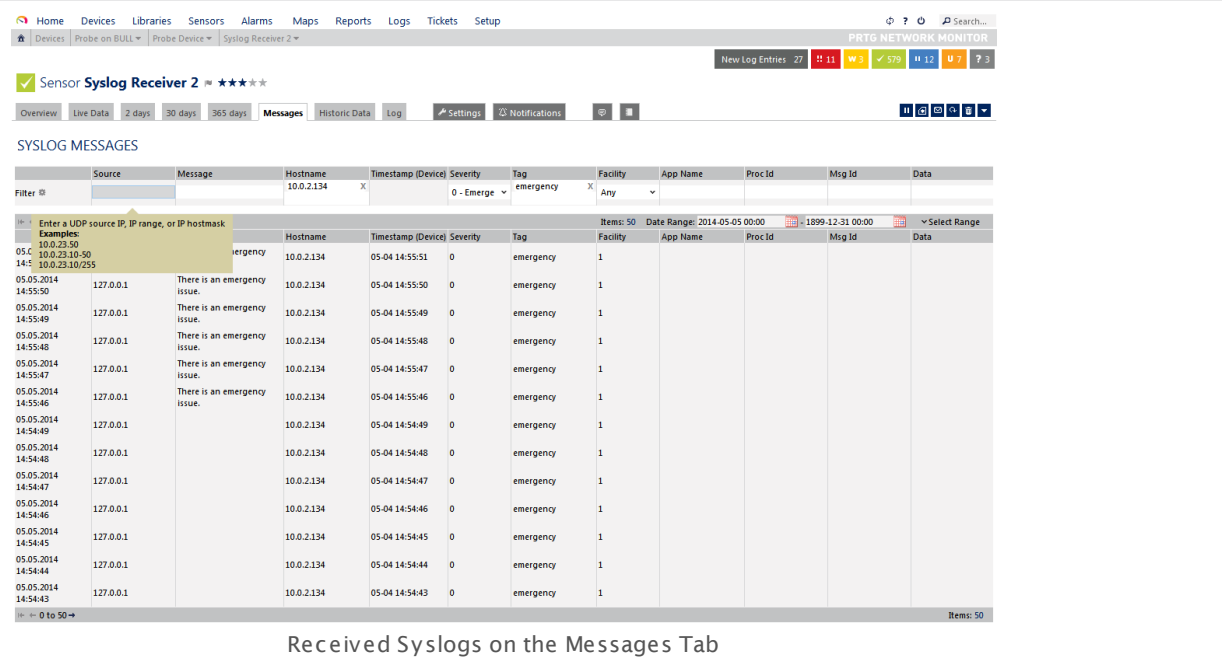


Syslog Receiver Sensor with Error Messages

Step 4: Review and analyze the collected data.
All incoming messages that match the include filter are processed and stored in PRTG's internal high-performance database. Review and analyze the received syslogs and traps via PRTG's web interface. For details, see the respective manual sections of **SNMP Trap Receiver Sensor** [2153] and **Syslog Receiver Sensor** [2319]. Then you can decide about further filtering of the incoming messages.

The received data is also available in PRTG's data folder [3226] as common files. One data file is created per hour.

In PRTG on premises you can add the Management Information Base (MIB) files of your devices to the **\MIB** subfolder to use them with the SNMP Trap Receiver sensor. This will result in Object Identifier (OID) resolution and makes trap messages more comprehensible. For example, instead of the OID 1.3.6.1.4.1.32446.1.1.2 you would see SNMPv2-SMI-v1::enterprises.32446.1.1.2 = 0 (example from the PRTG MIB).



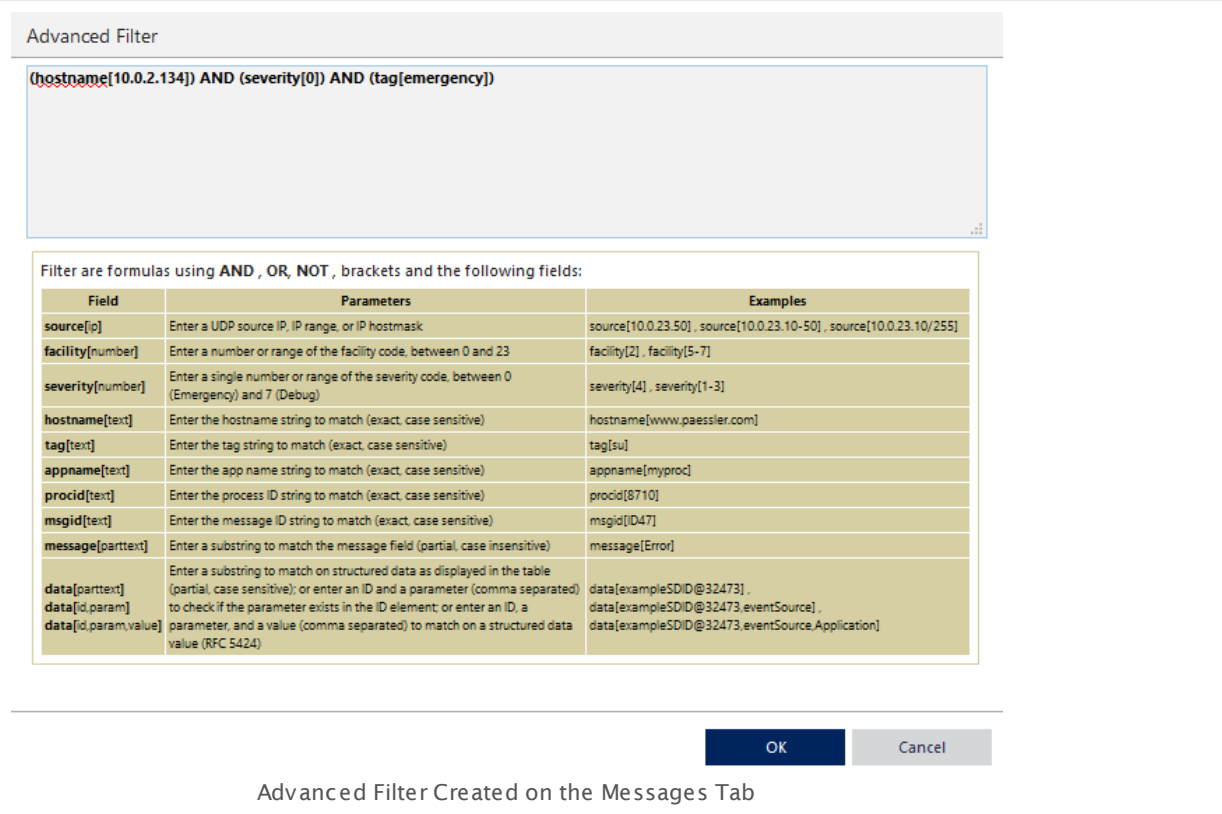
Received Syslogs on the Messages Tab

Step 5: (Optionally) refine the filters.
In order to increase productivity with your PRTG syslog servers and trap receivers, you can adjust the default filter settings. PRTG provides you a comprehensible formula system that you can use to describe what kind of messages you want to process and which of them will count as error or warning messages. You can configure the following filters for received messages in the settings of the respective receiver:

- **Include** filter: Process and store specific types of messages only.
- **Exclude** filter: Do not process specific types of messages and discard them.
- **Warning** filter: Define rules to categorize received messages as warnings.
- **Error** filter: Define rules to categorize received messages as errors.

Use the syntax that is provided in the corresponding manual sections to define your individual filter rules: SNMP Trap Receiver Sensor 2152 and Syslog Receiver Sensor 2318.

You can create filter rules with a few mouse clicks in the **Advanced Filter** on the **Messages** tab of a specific sensor and copy these rules into the sensor settings to apply them.



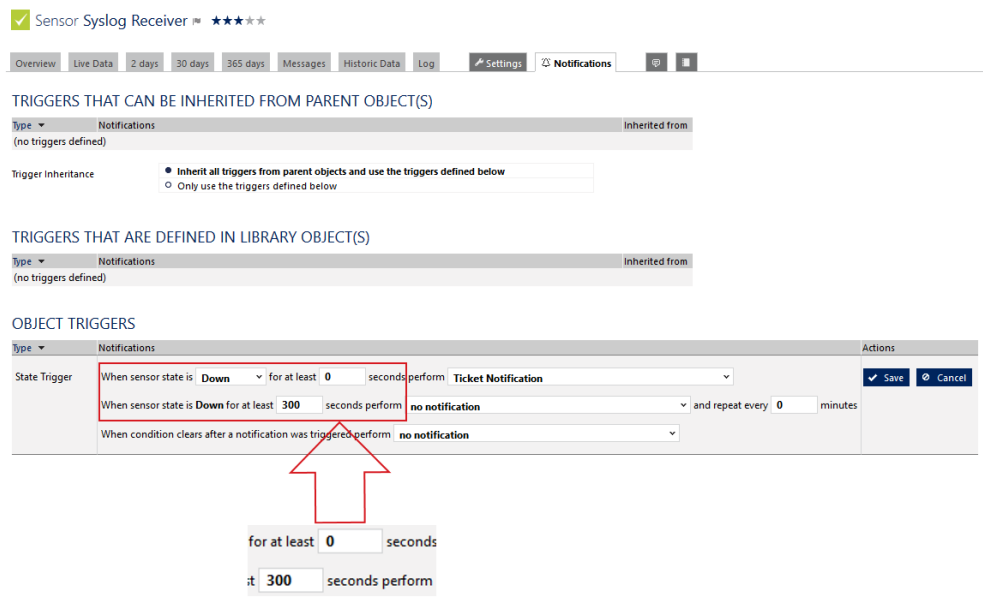
Advanced Filter Created on the Messages Tab

Step 6: (Optionally) create notification triggers.
By default, the warning and error channels of the Syslog and SNMP Trap Receiver sensors have a very low upper warning or error limit (0.00000001). The reason for this is that even when only one syslog or trap has been counted in the respective channel during a scanning interval, the overall status of the sensor will show this with the corresponding status. This way, you always recognize if there is something wrong on the monitored system.

Because of this sensor behavior, best practice would be to add a **State Trigger** on the **Notifications** 2829 tab of the sensor if you want to get a notification 128 when a warning or error message type comes in. Define 0 seconds **Down** or **Warning** time condition to not miss any warnings, errors, or any other messages. Another option would be a **Speed Trigger** for notifications regarding messages per second.

See also this Knowledge Base article: How can I configure sensors using speed limits to keep the status for more than one interval?

You can use syslog and trap specific placeholders in notification templates in order to see the messages when you receive a notification. See the **More** 3131 section below for more information.



State Trigger for a Syslog Receiver

Part 12

PRTG Administration Tool

12 PRTG Administration Tool

The **PRTG Administration Tool** is part of your PRTG installation and helps you edit administrative settings of your local probe and your remote probe installations.

You can launch the PRTG Administration Tool from the Windows start menu, on your core server, or on your remote probe server. If you start the PRTG Administration Tool on the PRTG core server, you can change settings that affect your whole PRTG installation and your local probe. If you run the PRTG Administration Tool on a system on which a remote probe runs, you can only change settings that are related to this probe.

All settings that you change will require a restart of the affected PRTG Windows services to apply any changes on the configuration. Please see the following sections for details.

You can also change many administrative settings via the **Setup** 2907 in the PRTG web interface 136. For probes, settings are also available on the corresponding tab 330 in the web interface.

You can review the history of all changes to the settings of the PRTG Administration Tool in the **Logs (Debug)** directory. The name of the corresponding logfile is **PRTG Administration Tool Changelog.log**. For information on how to find the folder used for storage, please see section **Data Storage** 3226.

12.1 PRTG Administration Tool on Core Server System

With the **PRTG Administration Tool** you can define various system-oriented settings that affect your PRTG installation, as well as restart services and view log information. You can also change many of these settings via the system administration 2907 in the PRTG web interface 136.

This section describes the available settings in the PRTG Administration Tool when you open the tool on the PRTG core server system. This means that you can edit settings that regard your PRTG core or web server and the local probe, which is the probe on your core server. If you open the PRTG Administration Tool on a remote probe machine, only probe related settings 3157 are available.

All settings you define are only valid for the local installation that is running on the computer on which you start the Administration Tool. In order to change settings for another installation, for example, another cluster node installation, please log in to that computer and open the program there.

Do you want to know how the PRTG Administration Tool relates to all other major parts of PRTG Network Monitor? To get familiar with the different components of PRTG, we recommend that you read the **Architecture** 111 section. If you prefer a video introduction to the **PRTG Administration Tool**, see the **More** 3156 section below for more information.

This feature is not available in PRTG on demand.

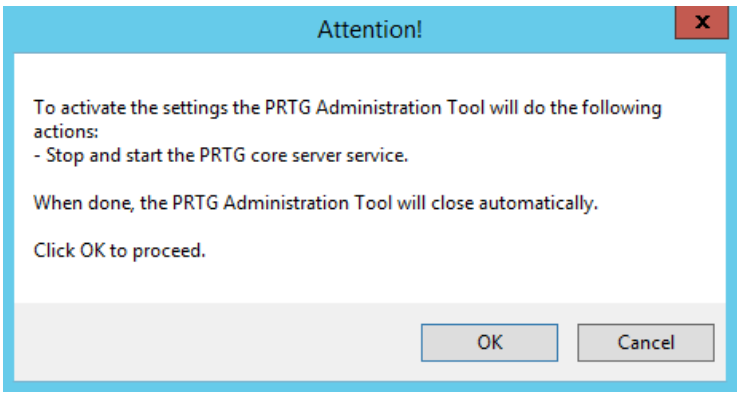
Start the PRTG Administration Tool

From the Windows start menu, select the **PRTG Network Monitor** group and click **PRTG Administration Tool** to open the application.

You can choose from these options in different tabs:

- Web Server 3136
- Core Server 3139
- Cluster 3141
- Administrator 3146
- Probe Settings for Core Connection 3148
- Probe Settings for Monitoring 3150
- Service Start/Stop 3151
- Logs and Infos 3154

After you change settings, click the **Save & Close** button. A new window opens where PRTG asks you to agree to restart the PRTG core server service. Click **OK** if you do not want your changes to be ignored.

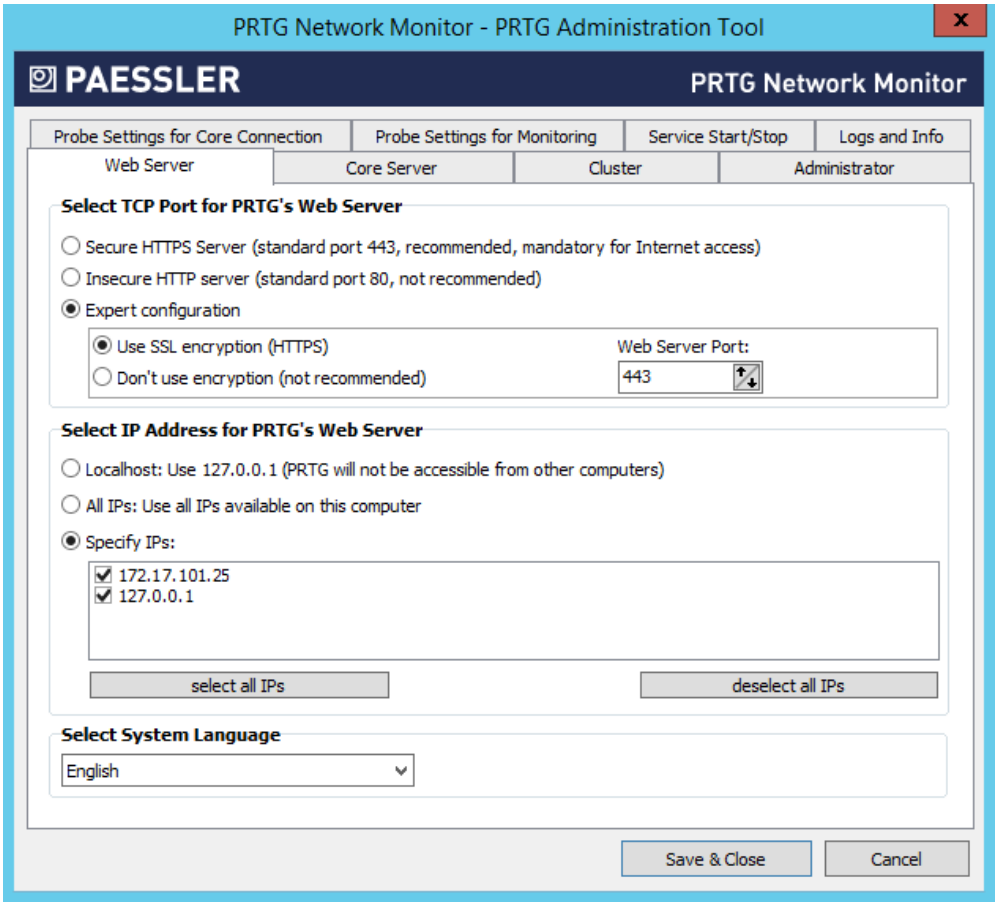


PRTG Administration Tool: Restart Services

Web Server

Edit IPs, ports, access methods, and language for the PRTG web interface 136.

You can also change all settings on the **Web Server** tab via the PRTG web interface in the User Interface 2943 settings.



PRTG Administration Tool

WEB SERVER

Select TCP Port for PRTG's Web Server

PRTG runs a web server in order to provide access via the web interface and the Enterprise Console. Please specify on which port this web server will run. Choose between:

- **Secure HTTPS server (recommended, mandatory for internet access)**: We recommend this setting and you need it to access the PRTG server via the internet. Use a secure HTTPS connection that is encrypted via SSL on port 443.
  Although the connection is secure, you will see an **SSL Certificate Warning** 142 in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see **Using Your Own SSL Certificate** 3228.

  If port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to port 443 via HTTPS. You can change this behavior by using a registry setting.
  If port 443 is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG will send a ticket 200 that shows you the currently used port number and will switch back to 443 as soon as it is available again.
- **Insecure HTTP server (standard port 80, not recommended)**: Use a standard web server without SSL encryption on port 80. This setting is not recommended for WAN connections.
  If you use an insecure web server on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.
- **Expert configuration**: This setting allows you to specify a custom web server port and the security of the connection. This option is intended for systems with an existing web server on the standard port. Define port and encryption below.
  If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft IIS web server also uses the port 80 (443 for SSL) by default and blocks it. Please disable such programs and services on startup.

Expert Configuration: SSL Encryption

You will see this setting only if you select **Expert configuration** above. Specify if you want to use an SSL encryption. Choose between:

WEB SERVER

- **Use SSL encryption (HTTPS)**: Use a secure HTTPS connection that is encrypted via SSL on a custom port as defined above.
  Although the connection is secure, you will see an SSL Certificate Warning 142 in your browser when you log in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see Using Your Own SSL Certificate 3228.
- **Don't use encryption (not recommended)**: This setting is not recommended for WAN connections. Use a standard web server without SSL encryption on a custom port as defined above.

If you use a web server without encryption on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend that you use this option in a LAN only.

Expert Configuration: Web Server Port

You will see this setting only if you select **Expert configuration** above. Enter the TCP port number you want the PRTG web server to run on. Please enter an integer value.

If you use a secure connection and port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will be redirected to the custom port via HTTPS. You can change this behavior by using a registry setting.

If the defined port for a secure connection is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG sends a ticket 200 that shows you the currently used port number and will switch back to the original port as soon as it is available again.

Select IP Address for PRTG's Web Server

PRTG is running a web server in order to provide access via the web and Windows interface. Please specify the IP address this web server will run on. Later, you can log in to PRTG by simply pointing your browser to the specified IP address.

Choose between:

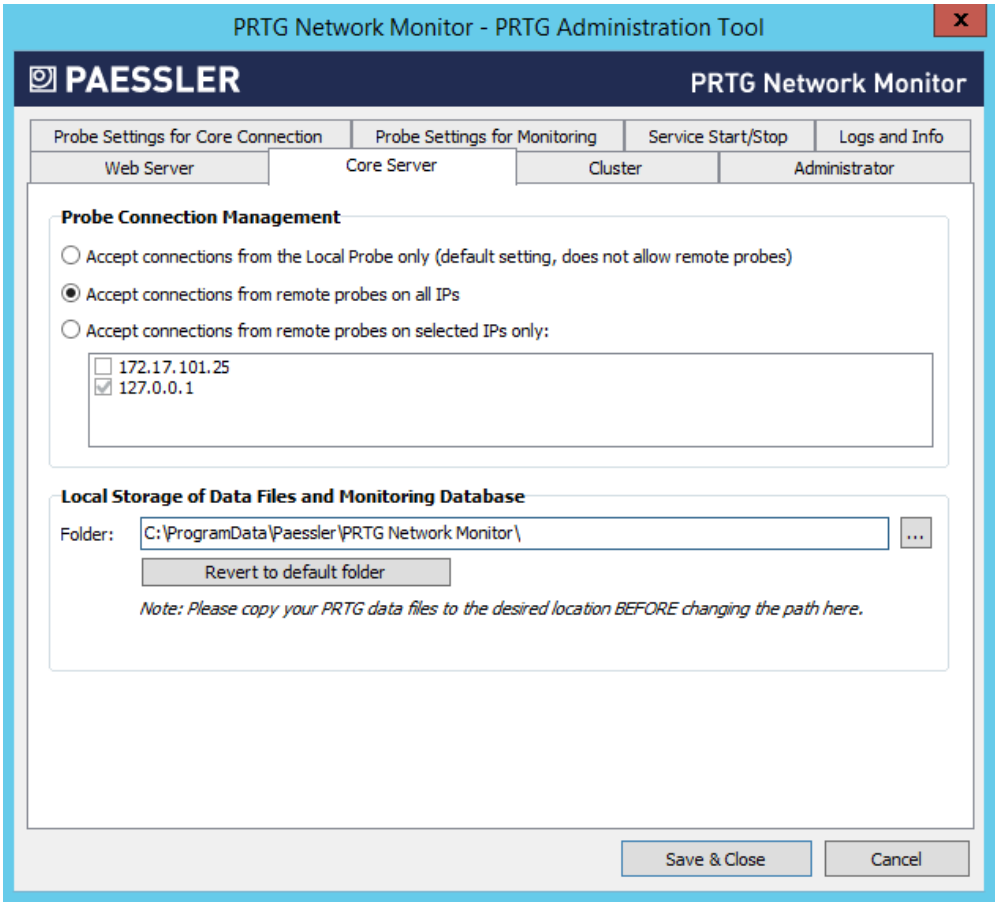
- **Localhost, 127.0.0.1 (PRTG will not be accessible from other computers)**: Use 127.0.0.1 only. The PRTG web interface and the Enterprise Console will only be accessible from the computer PRTG is installed on. Either the selected port or at least one port in the range from **8080** to **8089** has to be available on 127.0.0.1.

If you run PRTG on localhost, please do not use the DNS name http://localhost to log in to the web server, as this may considerably slow down the PRTG web interface. Please use your local IP address or http://127.0.0.1 instead.

WEB SERVER	
	▪ **All IPs available on this computer**: Use all IP addresses available on this computer and enable access to the web server for all of these addresses. The TCP port selected below must be free on every available IP address. ▪ **Specify IPs**: Select specific IP addresses on which the PRTG Web server will run. A list specific to your system is shown. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select and deselect all addresses by clicking on the check box in the table header. Either the selected port or at least one port in the range from **8080** to **8089** has to be available on the specified IP address. Regardless of the selected setting above, one port in the range from **8080** to **8180** has to be available on the specified IP address so PRTG can create reports. The report engine will try to connect to the core server on one of these ports. If PRTG does not find a network card on startup it will switch the IP setting to **Localhost**. This setting will remain, even if a network card is available later on. If you disabled or removed the network card on the machine running the PRTG core server, please re-check this setting.
Select System Language	Choose the system language from the dropdown list. Default is **English**. Depending on your installation, you may be able to choose other languages here. This setting defines the language of the PRTG web interface 136, as well as of the **PRTG Administration Tool** 3134.

Core Server

Define settings for the core server.



PRTG Administration Tool: Core Server

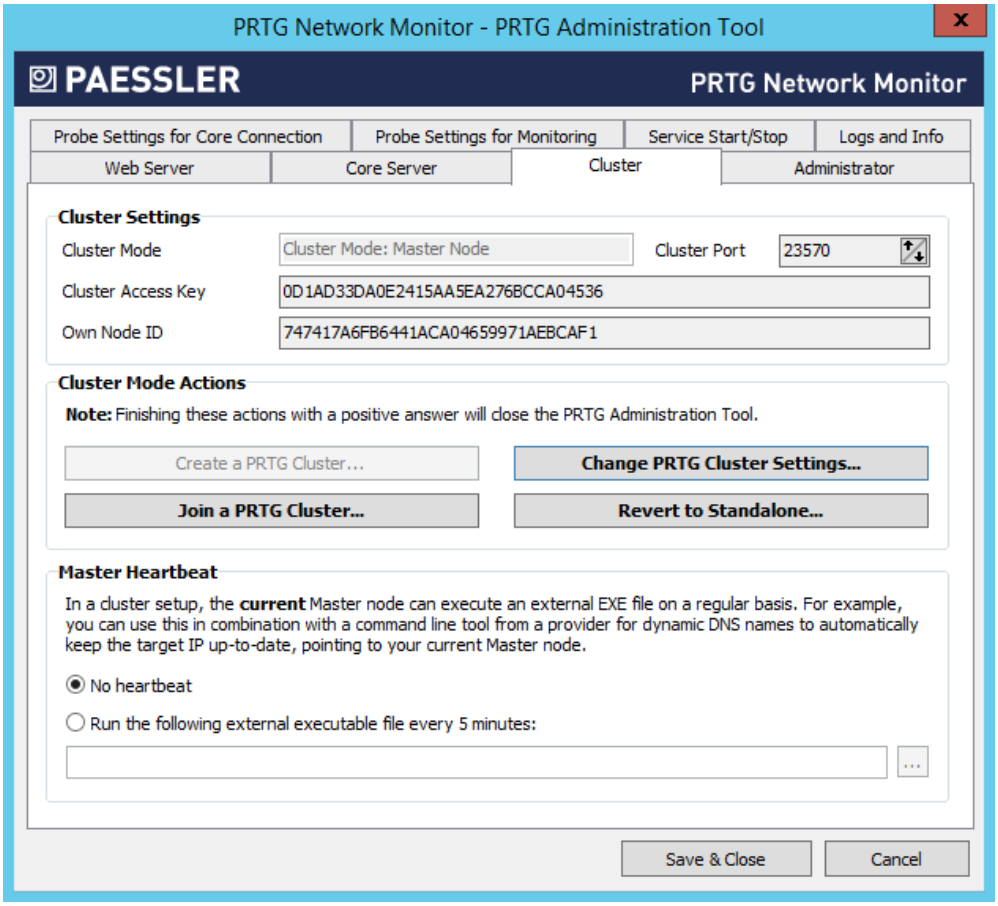
CORE SERVER

Probe Connection Management	Define how PRTG will handle incoming connections from probes. Choose between the following options: ▪ **Accept connections from the Local Probe only (default setting, does not allow remote probes)**: This is the default setting. Only local probe connections will be accepted by the PRTG core server. You cannot use remote probes 3195 with this setting enabled. ▪ **Accept connections from remote probes on all IPs**: Incoming connections from remote probes will always be accepted, no matter on which IP address of the core server they come in. ▪ **Accept connections from remote probes on selected IPs only**: Incoming connections from remote probes 3206 will only be accepted on the selected IP address(es) of the core server. In the list, select the IP addresses by adding a check mark in front of the desired IPs.

CORE SERVER	
	You can also change this setting in the PRTG web interface under **System Administration—Core & Probes** 2968.
Local Storage of Data Files and Monitoring Database	Define the data folder to which PRTG will store configuration and monitoring data. Click the **...** button to choose another folder on your system. Before you change the path, make sure you stop both the core server and the probe services and copy all data to the new location. Click **Revert to default folder** to reset to default.

Cluster

On the **Cluster** tab, you can manually change how the current core installation will behave in a cluster. Before changing settings here, please read the **Failover Cluster Configuration** 3212 section.



PRTG Administration Tool: Cluster

CLUSTER

Cluster Settings

Depending on the current cluster settings, you will see different information here.

- **Cluster Mode**: Shows which cluster mode the current installation is running. This setting is shown for your information only and cannot be changed here. Possible values are **Standalone** (no cluster mode), **Cluster Mode: Master Node**, or **Cluster Mode: Failover Node**.
- **Cluster Port**: This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here.
- **Cluster Access Key**: This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here.

CLUSTER

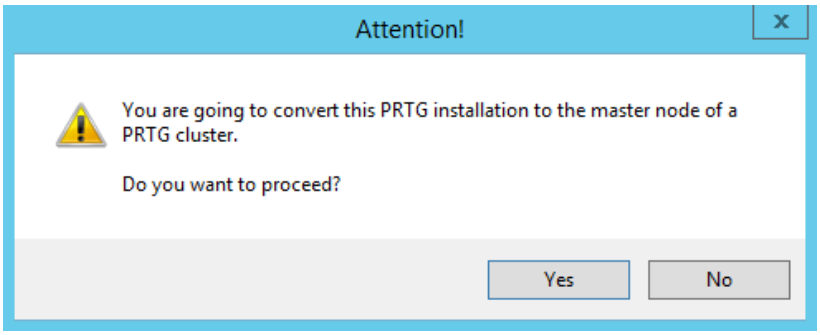
	▪ **Own Node ID**: This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here.
Cluster Mode Actions	Depending on the current cluster settings, you see different active buttons here. ▪ **Create a PRTG Cluster...** ▪ **Join a PRTG Cluster...** ▪ **Change PRTG Cluster Settings...** ▪ **Revert to Standalone...** For details on these options, please see below this table 3143.
Master Heartbeat	This section is only visible if you are running your PRTG installation in cluster mode. The current master can execute an external executable file on a regular basis. We call this a "heartbeat". You can use this, for example, to report the IP address of the current master node to a dynamic DNS provider, so a DNS name is always redirected to the current PRTG master node in case the original master node fails and a failover node (running at a different IP address) takes over the master role. Choose between: ▪ **No heartbeat:** Do not execute a file on a regular basis. ▪ **Run the following external executable file every 5 minutes:** Click the **...** button to choose a file you want to execute. This can be, for example, a command line tool, or a batch file. It will be executed on the current master node only, with a fixed interval of five minutes. The interval cannot be changed. Please make sure that the selected file is available under the same (local) path on all failover nodes. In case one of your failover nodes becomes current master, the heartbeat can only be executed reliably if the executable file exists on all of your failover nodes.

Cluster Mode Actions

Follow these instructions to create or join a cluster, to change a cluster's settings, or to revert a cluster node to a standalone PRTG installation:

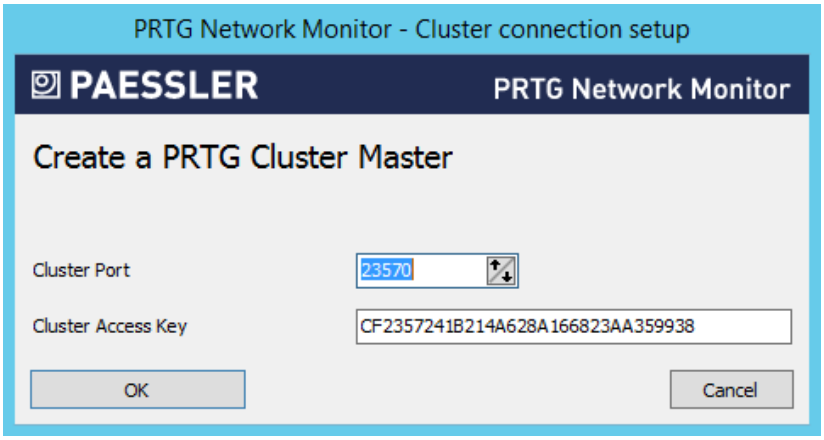
Create a PRTG Cluster...

- Click this button to start creating a cluster. The current PRTG core server will then be the **Master Node** of your cluster.
- Click **Yes** to confirm the conversion of this installation into a cluster master node.



Converting an Installation into a Cluster Master Node

- A new dialog box will appear.



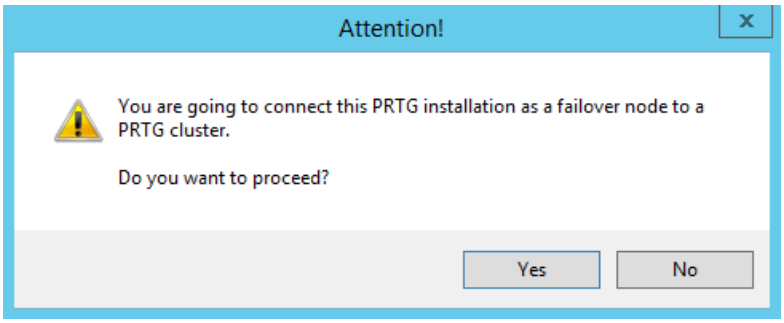
PRTG Administrator: Creating a Cluster Master

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- We recommend that you use the default value.
- Save the **Cluster Access Key** so you have it at hand when configuring your **Failover Node (s)**.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Join a PRTG Cluster...

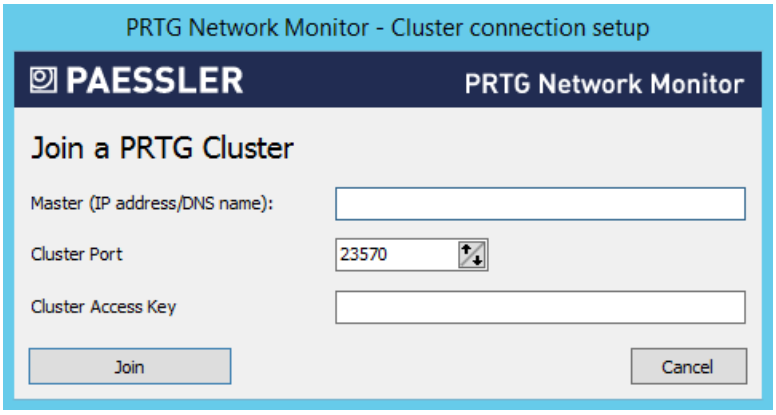
- Click this button to add this installation to an existing cluster that already has a **Master Node**. The current PRTG core server will then be a **Failover Node** in the cluster.

- This button is also available if you are currently running your PRTG installation in **Cluster Mode: Master Node**. This option will then change your master node to a failover node!
- Click **Yes** to confirm the conversion of this installation into a failover node.



Converting an Installation into a Cluster Failover Node

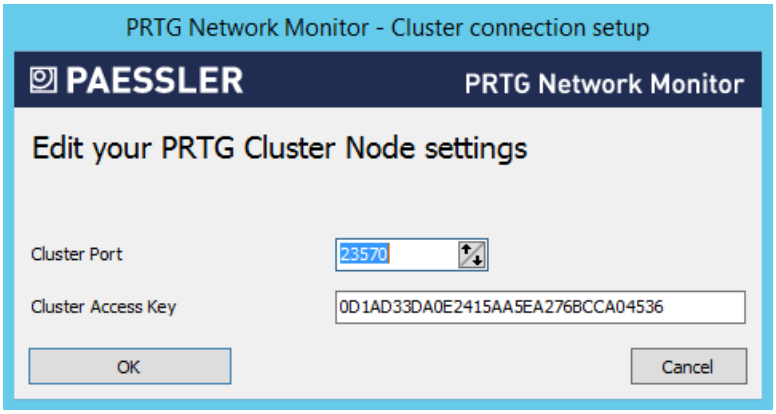
- A dialog box will appear.



PRTG Server Administrator

- Enter a **Master IP address/DNS name** for your cluster. It must be reachable from the machine running the failover node.
- Enter the other settings as defined in the settings of your **Master Node.** Please make sure you use the same settings on all nodes in your cluster.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Change PRTG Cluster Settings...



PRTG Server Administrator

- If you are running your PRTG installation in cluster mode, you can change the settings here. A new window will appear.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- Please make sure you use the same settings on all nodes in your cluster.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

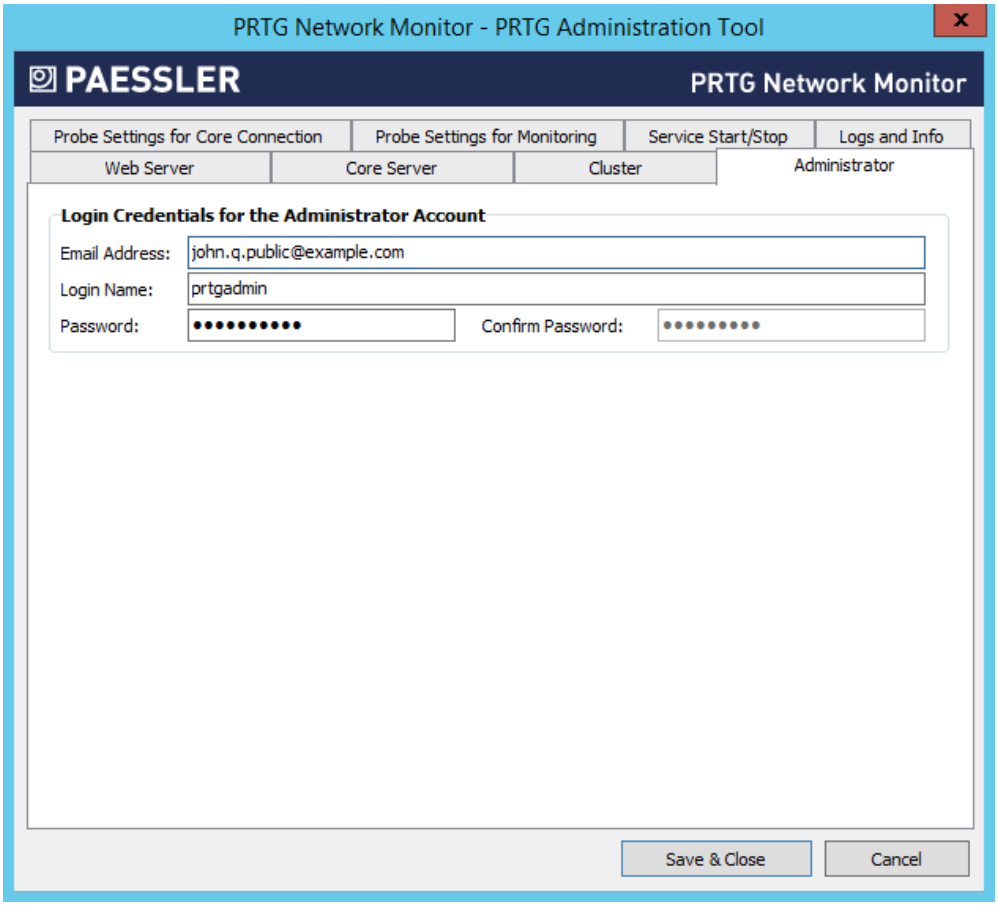
Revert to Standalone...

- If you are currently running your PRTG installation in cluster mode, you can change it to **Standalone** mode. If you do so, this node will no longer be part of a cluster.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Administrator

Change PRTG System Administrator specific settings.

You can also change these settings in the account settings 2976 of the **PRTG System Administrator** user in the PRTG web interface.



PRTG Administration Tool: Administrator

LOGIN CREDENTIALS FOR THE ADMINISTRATOR ACCOUNT

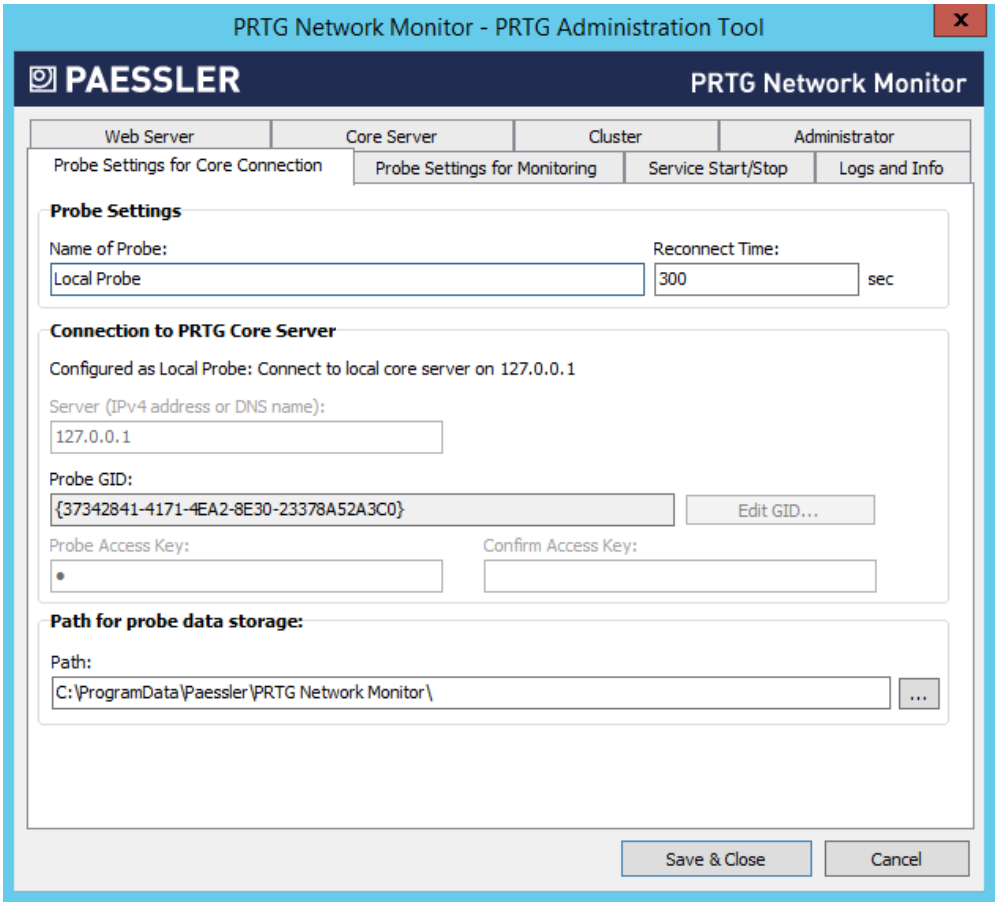
Email Address	Enter a valid email address for the administrator. By default, PRTG will send notifications and important messages to this address.
Login Name	Enter a name for the **PRTG System Administrator** login. This is your default login! You use it when you log in to the PRTG web interface or Enterprise Console. ⓘ The default login name is **prtgadmin.**
Password	Enter a password for the **PRTG System Administrator** login. This is your default login! You use it when you log in to the PRTG web interface or Enterprise Console. ⓘ The default password is **prtgadmin.**

LOGIN CREDENTIALS FOR THE ADMINISTRATOR ACCOUNT

Confirm Password	If you change your password, re-enter the password for the **PRTG System Administrator** login to confirm it.

Probe Settings for Core Connection

Define general settings regarding the probe and probe connections.



PRTG Administration Tool: Probe Settings for Core Connection

PROBE SETTINGS

Name of Probe	Enter a meaningful name to identify the probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Please enter a string.

PROBE SETTINGS

Reconnect Time	Define the time that PRTG will wait until the probe tries to reconnect to the core server if the connection fails. Please enter an integer value.

CONNECTION TO PRTG CORE SERVER

These settings affect the way the probe will connect to the core server. A probe is either a local probe or a remote probe. PRTG will automatically detect the type of probe and show the correct setting options.

Server (IPv4 address or DNS name)	If this probe is configured as the **Local Probe** of the PRTG core installation, it will connect to the core via 127.0.0.1, which you cannot change. If this probe is configured as a **Remote Probe**, enter the IP address or DNS name of the core server.
Probe GID	The **Probe GID (global ID (GID))** is a unique identifier for the probe. We recommend that you do not change it. Exception: Only if you substitute an existing remote probe from a different computer, you have to copy the GID from the old probe to the new probe. To do so, click the **Edit GID...** button and confirm the warning with **Yes**. You can then change the value. You cannot change the GID for a local probe. You can deny GIDs under **System Administration—Core & Probes** 2968 in the PRTG web interface. If you remove a remote probe from the device tree or if you deny a remote probe after installation 98, its global ID (GID) will be automatically entered in the **Deny GIDs** list.
Probe Access Key	You do not need an access key for **Local Probe** connections. On a **Remote Probe**, the **Probe Access Key** must match one of the access keys configured in your PRTG core server installation. If it does not match, the remote probe will not be able to connect to the core server. Please see the **System Administration—Core & Probes** 2968 section for more information. Check also allowed and denied IPs in **System Administration—Core & Probes** 2968 to ensure that the core server accepts the IP address of the remote probe.
Confirm Access Key	If you enter an access key for a remote probe, enter it in this field again to assure correctness.

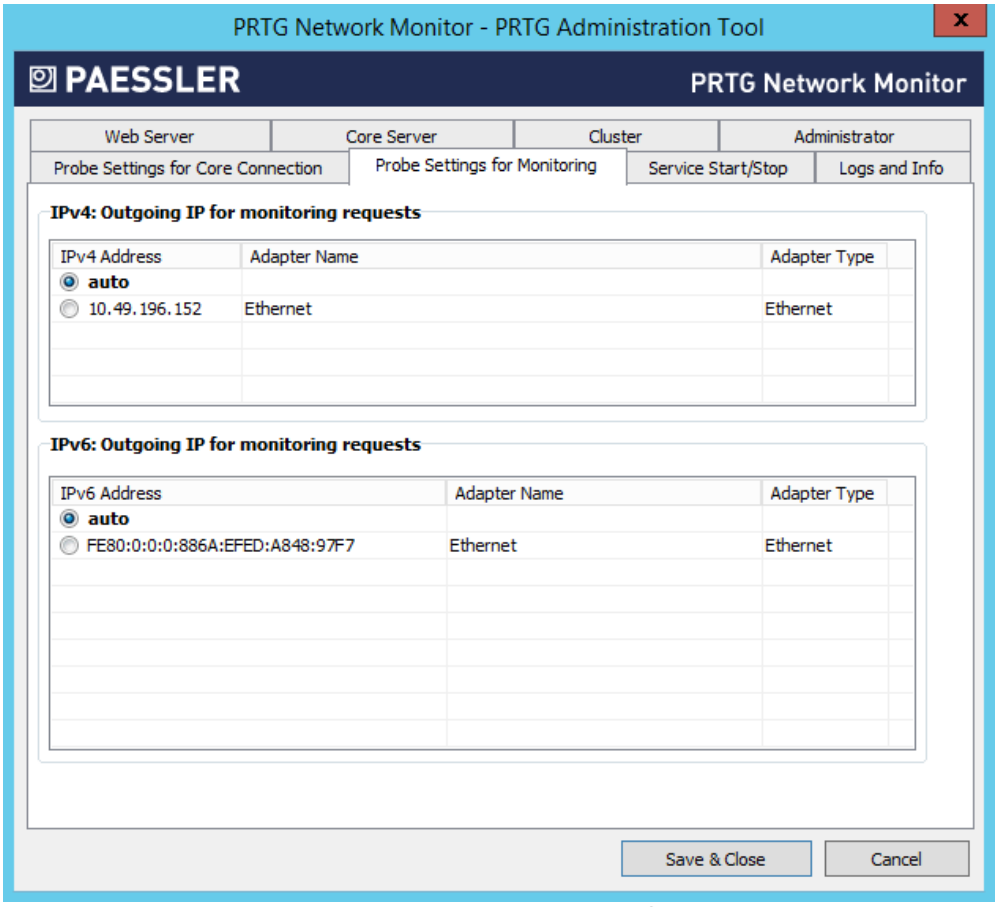
PATH FOR PROBE DATA STORAGE

Path	Define the data folder to which PRTG will store configuration and monitoring data. Click the **...** button to choose another folder on your system. Before you change the path, make sure you stop both the core server and the probe services and copy all data to the new location.

LANGUAGE FOR THE PRTG ADMINISTRATION TOOL FOR REMOTE PROBES

<your language>	Choose the language for the PRTG Administration Tool on your remote probe from the dropdown list. Default is **English**.

Probe Settings for Monitoring



PRTG Administration Tool: Probe Settings for Monitoring

PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that PRTG will use for outgoing monitoring requests of certain sensor types.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP.
- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

This feature does not support all sensor types for technical reasons.

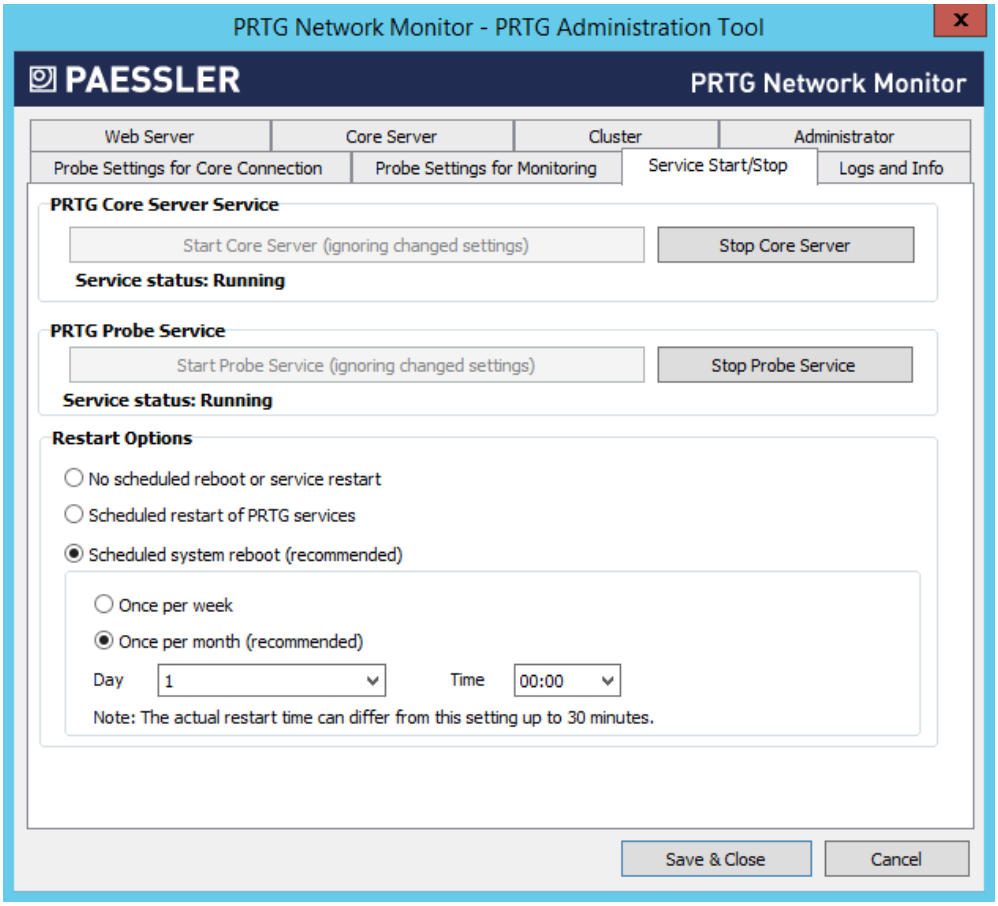
If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

Outgoing IPv4	Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.
Outgoing IPv6	Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**. For details about the basic concept of IPv6 in PRTG, please see the **IPv6** 133 section.

Service Start/Stop

You can stop and start PRTG Windows services manually. For connected probes, click **Start Core Server** to start the service or **Stop Core Server** to stop it. Both actions usually take from a few seconds up to several minutes to complete. You can also restart the core server and connected probes via the PRTG web interface under **Administrative Tools** 2988.

We recommend that you set a schedule for automatic system restarts.



PRTG Administration Tool: Start and Stop Service

You can also define a restart schedule on the **Settings** tab of a probe under **Restart Options**, in the PRTG web interface.

SCHEDULED RESTART SETTINGS

This setting is not available for local probes in PRTG on demand.

Restart Options	For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options:

SCHEDULED RESTART SETTINGS

- **No scheduled reboot or service restart**: Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under **System Administration—Administrative Tools** 2987 in the PRTG web interface.
- **Scheduled restart of PRTG services**: Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below.
- **Scheduled system reboot (recommended)**: We recommend this setting, although it is not set by default. Enter a schedule below. We recommend that you restart Windows servers once a month for best performance.

Restart Schedule

You can only see this setting if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server:

- **Once per week**: Select a day of the week and a time below.
- **Once per month (recommended)**: Select a day of the month and a time below.

Specify Day

You can only see this setting if you selected a schedule option above. Select a specific day of a week (Monday to Sunday) or month (1st to 30th or Last). If you select **Last**, the restart will always be executed on the last day of the month, regardless of how many days the month has.

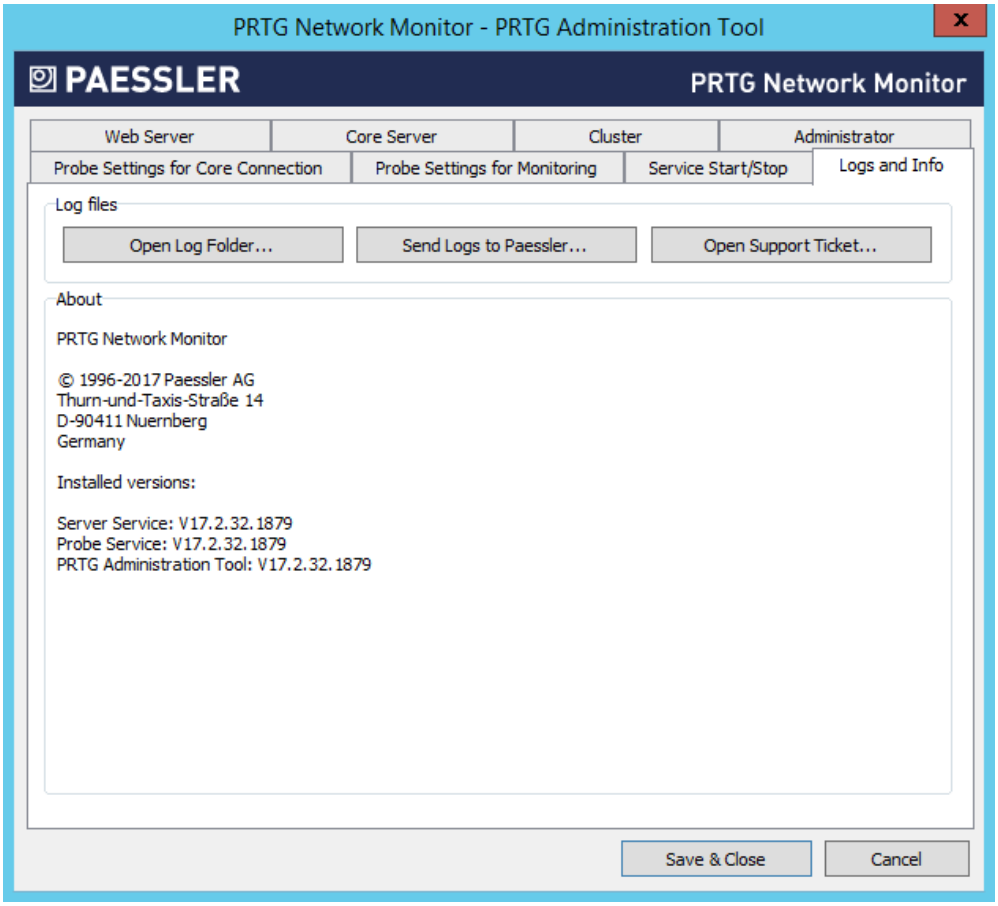
ⓘ If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.

Specify Hour

You can only see this setting if you selected a schedule option above. Select the time of day when PRTG will perform the restart.

ⓘ You will get a Windows warning message 10 minutes before the restart to inform you if you are a currently logged in user. The actual restart time can differ up to 30 minutes from the settings you enter here.

Logs and Info



PRTG Administration Tool: Logs and Info

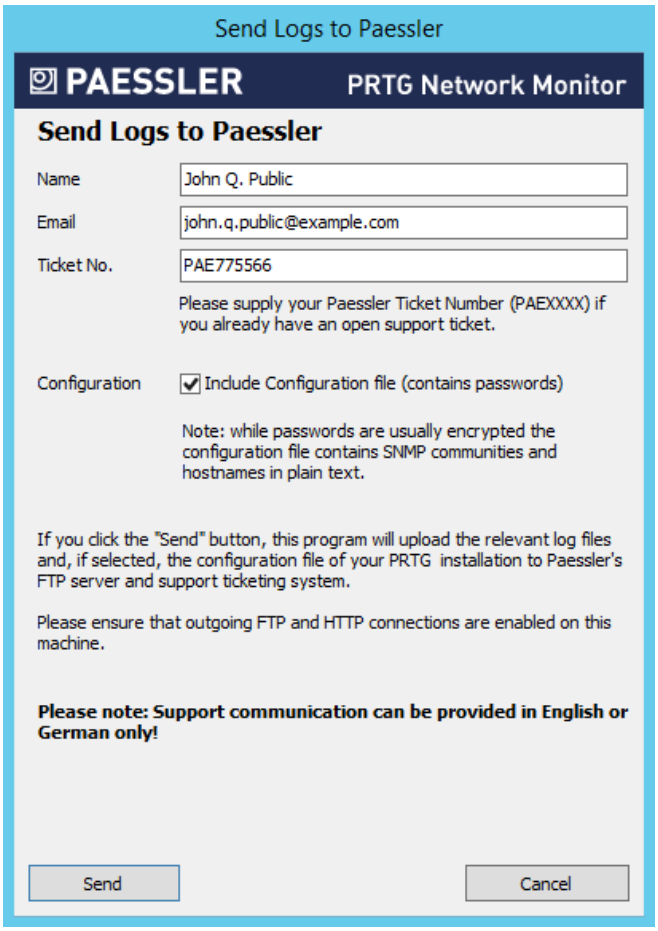
LOG FILES

Open Log Folder...	Open the PRTG Network Monitor data directory on your hard disk drive to access all logfiles that PRTG creates.
Send Logs to Paessler...	Open an assistant to send logfiles to the Paessler support team. Please see below for details 3166.
	You can send logfiles more easily with the support bundle via **Contact Support** 3024 in the PRTG web interface.
Open Support Ticket...	This will open the support form on the Paessler website in a browser window.
	If you need help, we recommend that you use the **Contact Support** 3024 option in the PRTG web interface instead.

The **About** section shows information about the version of installed PRTG programs and copyright.

Send Logs to Paessler

You can send logfiles more easily with the support bundle via **Contact Support** 3024 in the PRTG web interface.



Send Logs to Paessler

If you open a support ticket, Paessler support might ask you to send logfiles for further analysis. With the **Send Logs to Paessler...** button, PRTG will automatically collect, compress, and send your logfiles to our FTPS server.

SEND LOGS TO PAESSLER

Name	Enter your name.

SEND LOGS TO PAESSLER

Email	Enter a valid email address. You can provide any of your addresses, but we recommend that you use the email address of your PRTG account, which is entered by default.
Ticket No.	This field is optional. If you have already opened a ticket at Paessler support, please provide the ticket number you received. Your files will then be associated with your ticket automatically. Please enter the ticket number starting with PAE followed by four or more digits, for example, PAE12345. If you do not have a ticket number, leave this field empty.
Configuration	Define if you want to include the configuration file in the data. PRTG will remove all passwords from the config file before sending it to our support team.

Click the **Send** button to start the data upload. Ensure that FTPS and HTTP connections are allowed on this machine.

12.2 PRTG Administration Tool on Remote Probe Systems

If you start the **PRTG Administration Tool** on a system on which a PRTG **Remote Probe** 3196 runs, you can define various probe related settings, restart services, and view log information. You can also change many of these settings via the system administration 2907 and the probe settings tab 330 in the PRTG web interface 136.

This section describes the available settings in the PRTG Administration Tool when you open the tool on a PRTG remote probe system. This is not the complete set of available settings. If you need access to all possible settings regarding your whole PRTG installation, open the PRTG Administration Tool on the PRTG core server machine.

All settings you make here are valid only for the local installation running on the computer on which you open the PRTG Administration Tool. In order to change settings for another installation, for example, another remote probe installation, please log in to that computer and open the program there.

To get familiar with the different components of PRTG, we recommend that you read the **Architecture** 111 section. If you prefer a video introduction to the **PRTG Administration Tool**, see the **More** 3156 section below for more information.

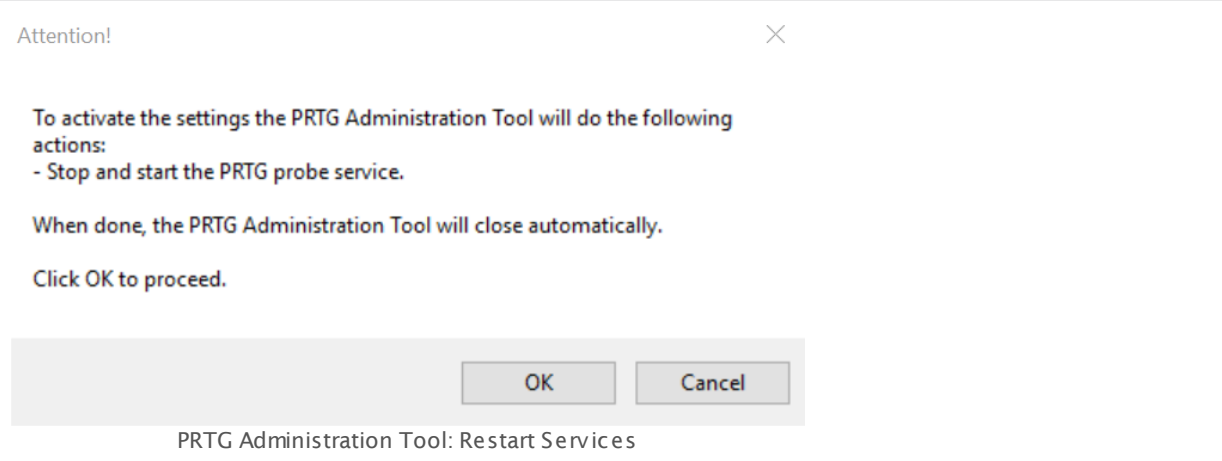
Start the PRTG Administration Tool

From the Windows start menu, select the **PRTG Network Monitor** group and click **PRTG Administration Tool** to open the application.

You can choose from these options in different tabs:

- Probe Settings for Core Connection 3158
- Probe Settings for Monitoring 3161
- Service Start/Stop 3162
- Logs and Infos 3165

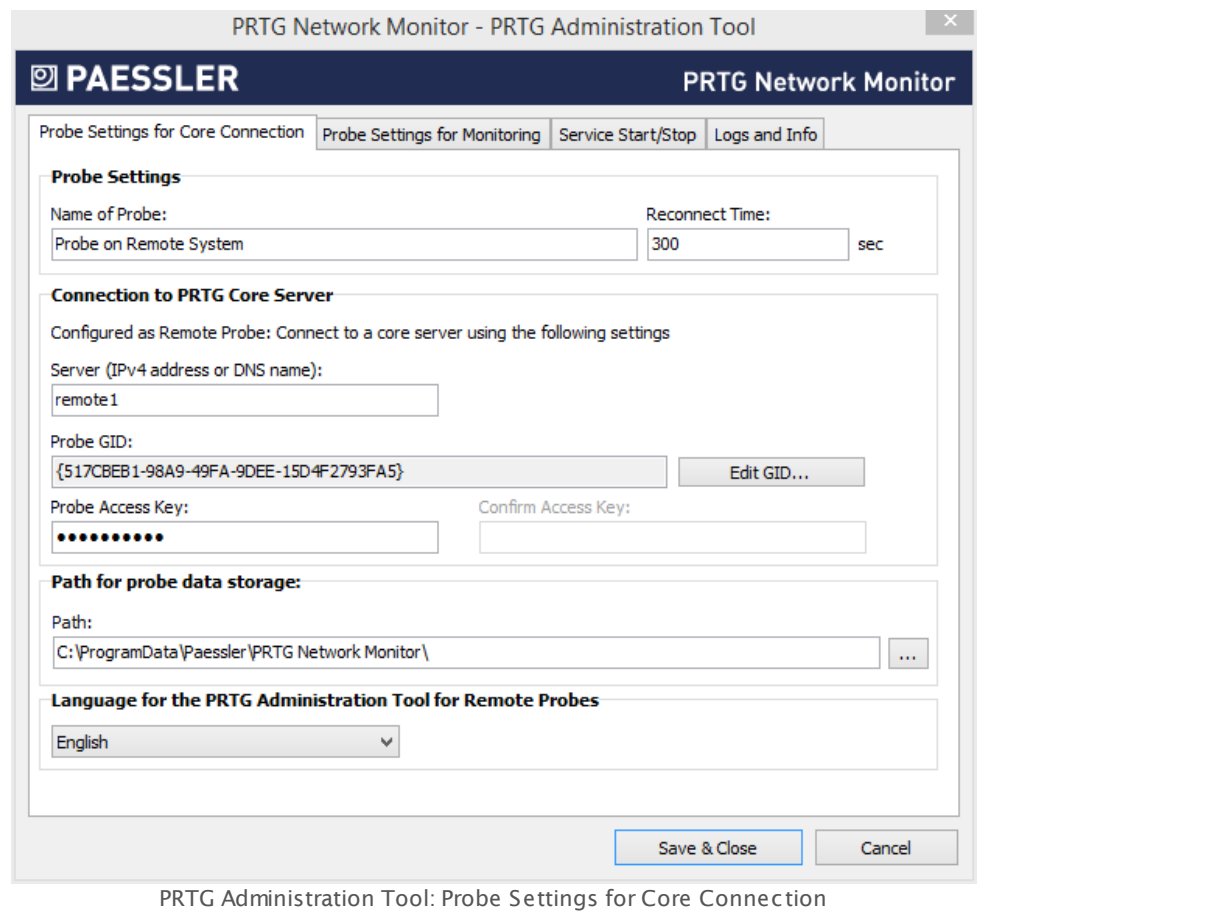
After you have changed settings, click the **Save & Close** button. A new window opens where PRTG asks you to agree to restart the PRTG core server service. Click **OK** if you do not want your changes to be ignored.



PRTG Administration Tool: Restart Services

Probe Settings for Core Connection

Define general settings regarding the probe and probe connections.



PRTG Administration Tool: Probe Settings for Core Connection

PROBE SETTINGS

Name of Probe	Enter a meaningful name to identify the probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Please enter a string.
Reconnect Time	Define the time that PRTG will wait until the probe tries to reconnect to the core server if the connection fails. Please enter an integer value.

CONNECTION TO PRTG CORE SERVER

These settings affect the way the probe will connect to the core server. A probe is either a local probe or a remote probe. PRTG will automatically detect the type of probe and show the correct setting options.

Server (IPv4 address or DNS name)	If this probe is configured as the **Local Probe** of the PRTG core installation, it will connect to the core via 127.0.0.1, which you cannot change. If this probe is configured as a **Remote Probe**, enter the IP address or DNS name of the core server.
Probe GID	The **Probe GID (global ID (GID))** is a unique identifier for the probe. We recommend that you do not change it. Exception: Only if you substitute an existing remote probe from a different computer, you have to copy the GID from the old probe to the new probe. To do so, click on the **Edit GID...** button and confirm the warning with **Yes**. You can then change the value. You cannot change the GID for a local probe. ⓘ You can deny GIDs under **System Administration—Core & Probes** 2968 in the PRTG web interface. If you remove a remote probe from the device tree or if you deny a remote probe after installation 98, its global ID (GID) will be automatically entered in the **Deny GIDs** list.
Probe Access Key	You do not need an access key for **Local Probe** connections. On a **Remote Probe**, the **Probe Access Key** must match one of the access keys configured in your PRTG core server installation. If it does not match, the remote probe will not be able to connect to the core server. Please see the **System Administration—Core & Probes** 2968 section for more information. ⓘ Check also allowed and denied IPs in **System Administration—Core & Probes** 2968 to ensure that the core server accepts the IP address of the remote probe.

CONNECTION TO PRTG CORE SERVER

Confirm Access Key	If you enter an access key for a remote probe, enter it in this field again to assure correctness.

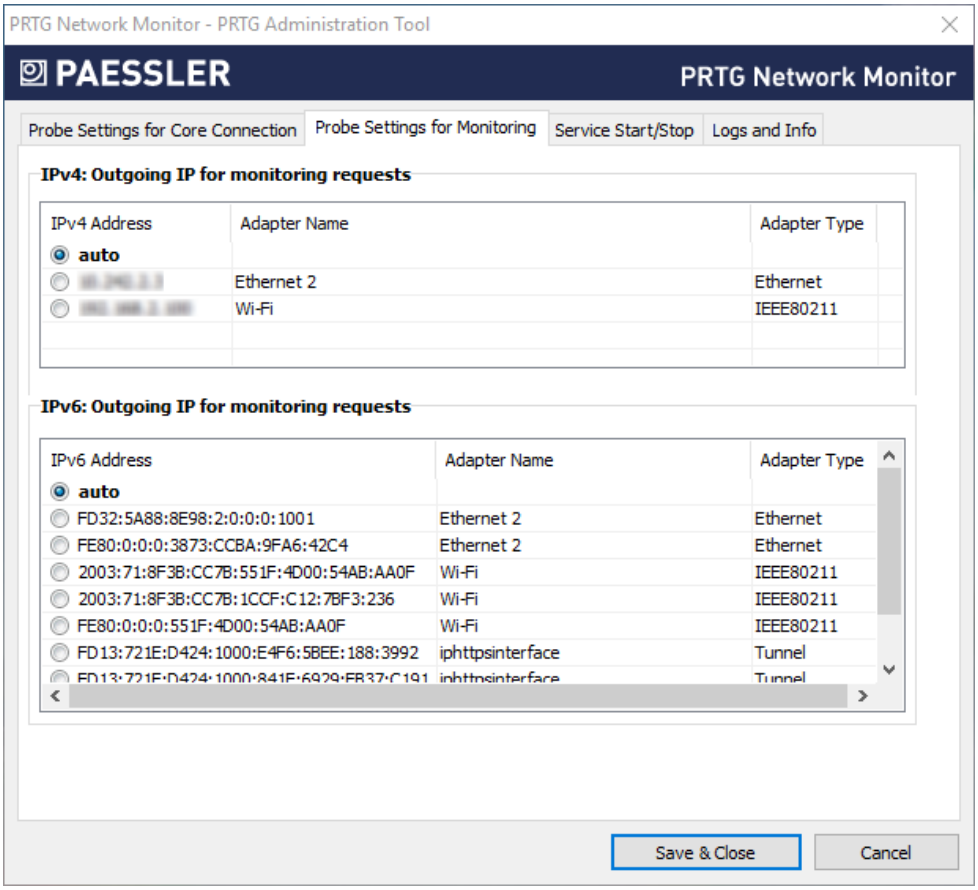
PATH FOR PROBE DATA STORAGE

Path	Define the data folder to which PRTG will store configuration and monitoring data. Click the **...** button to choose another folder on your system. Before you change the path, make sure you stop both the core server and the probe services and copy all data to the new location.

LANGUAGE FOR THE PRTG ADMINISTRATION TOOL FOR REMOTE PROBES

<your language>	Choose the language for the PRTG Administration Tool on your remote probe from the dropdown list. Default is **English**.

Probe Settings for Monitoring



PRTG Administration Tool: Probe Settings for Monitoring

PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that PRTG will use for outgoing monitoring requests of certain sensor types.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP.
- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

This feature does not support all sensor types for technical reasons.

PROBE SETTINGS FOR MONITORING

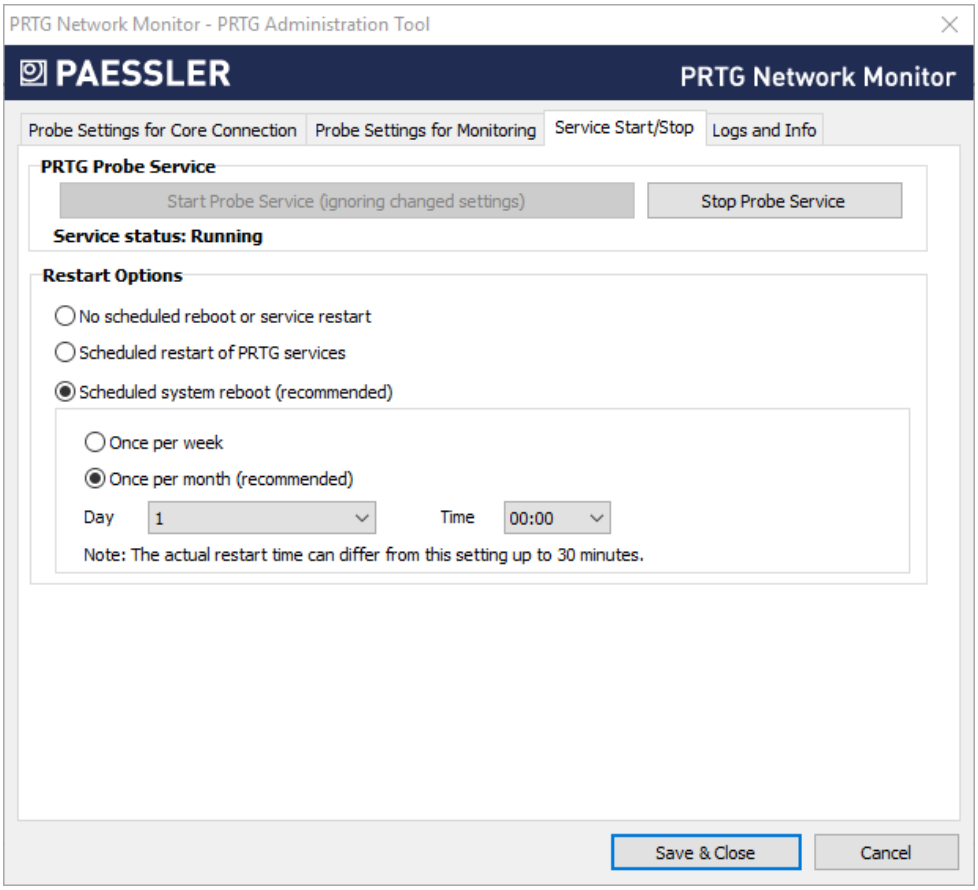
If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

Outgoing IPv4	Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.
Outgoing IPv6	Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**. For details about the basic concept of IPv6 in PRTG, please see the **IPv6** 133 section.

Service Start/Stop

You can stop and start PRTG Windows services manually. For connected probes, click **Start Probe Service** to start the service or **Stop Probe Service** to stop it. Both actions usually take from a few seconds up to several minutes to complete. You can also restart the core server and connected probes via the PRTG web interface under **Administrative Tools** 2988.

We recommend that you set a schedule for automatic restarts.



PRTG Administration Tool Start and Stop Service

You can also define a restart schedule on the **Settings** 312 tab of a probe under **Restart Options**, in the PRTG web interface.

SCHEDULED RESTART SETTINGS

This setting is not available for local probes in PRTG on demand.

Restart Options

For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options:

- **No scheduled reboot or service restart**: Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under **System Administration—Administrative Tools** 2987 in the PRTG web interface.

SCHEDULED RESTART SETTINGS

- **Scheduled restart of PRTG services**: Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below.
- **Scheduled system reboot (recommended)**: We recommend this setting, although it is not set by default. Enter a schedule below. We recommend that you restart Windows servers once a month for best performance.

Restart Schedule

You can only see this setting if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server:

- **Once per week**: Select a day of the week and a time below.
- **Once per month (recommended)**: Select a day of the month and a time below.

Specify Day

You can only see this setting if you selected a schedule option above. Select a specific day of a week (Monday to Sunday) or month (1st to 30th or Last). If you select **Last**, the restart will always be executed on the last day of the month, regardless of how many days the month has.

If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.

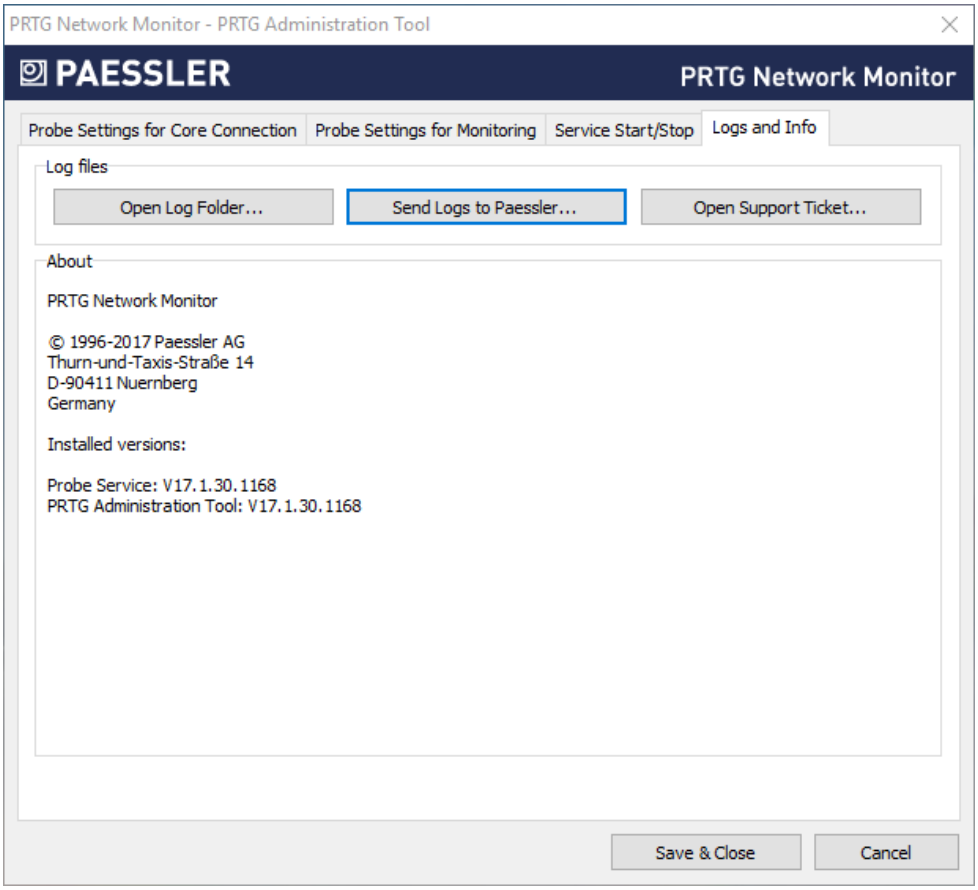
Specify Hour

You can only see this setting if you selected a schedule option above. Select the time of day when PRTG will perform the restart.

You will get a Windows warning message 10 minutes before the restart to inform you if you are a currently logged in user. The actual restart time can differ up to 30 minutes from the settings you enter here.

You can also define a restart schedule on the **Settings** tab of a probe, section **Scheduled Restart Settings** 330, in the PRTG web interface.

Logs and Info



PRTG Administration Tool: Logs and Info

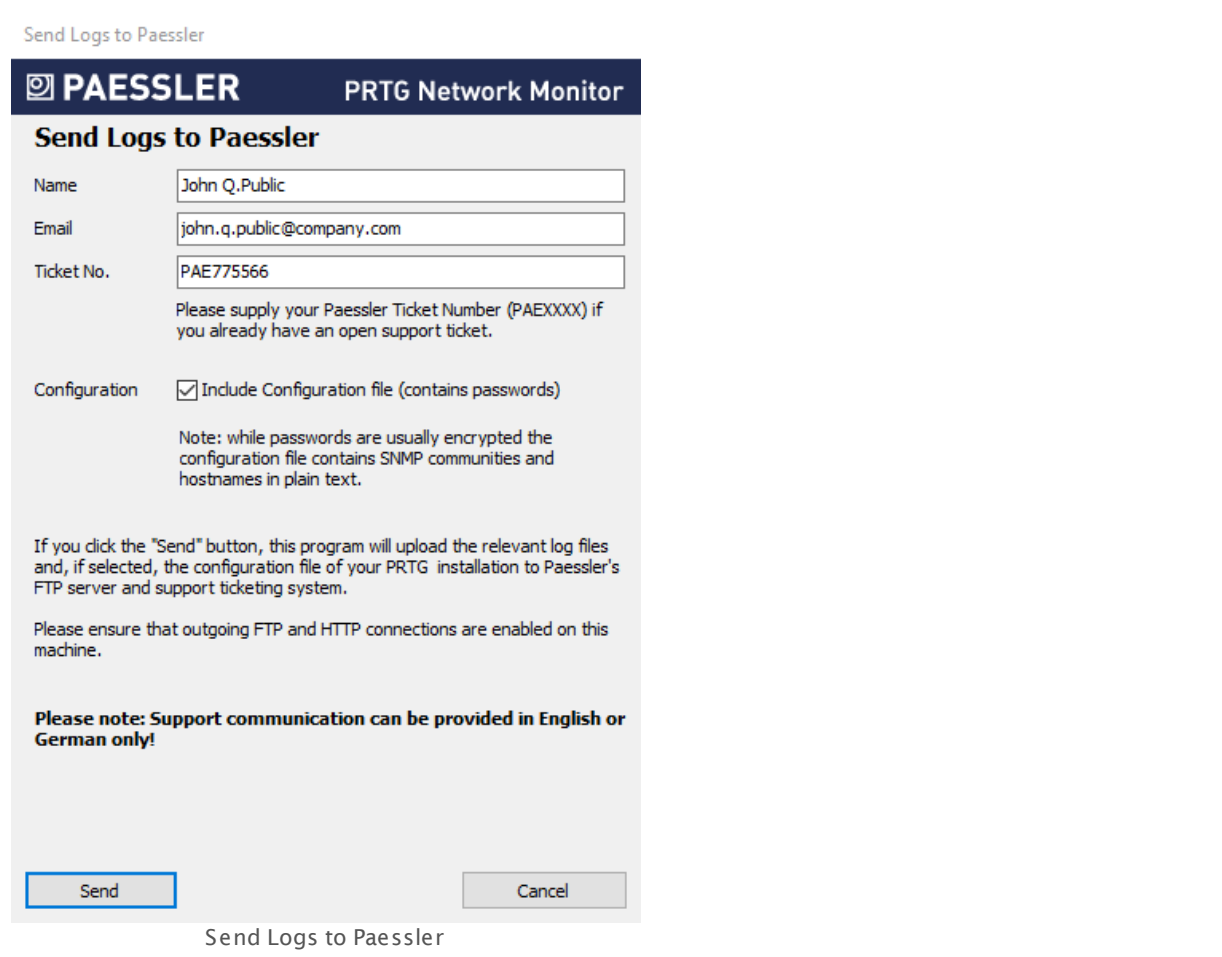
LOG FILES

Open Log Folder...	Open the PRTG Network Monitor data directory on your hard disk drive to access all logfiles that PRTG creates.
Send Logs to Paessler...	Open an assistant to send logfiles to the Paessler support team. Please see below for details 3166.
	You can send logfiles more easily with the support bundle via **Contact Support** 3024 in the PRTG web interface.
Open Support Ticket...	This will open the support form on the Paessler website in a browser window.
	If you need help, we recommend that you use the **Contact Support** 3024 option in the PRTG web interface instead.

The **About** section shows information about the version of installed PRTG programs and copyright.

Send Logs to Paessler

You can send logfiles more easily with the support bundle via **Contact Support** 3024 in the PRTG web interface.



Send Logs to Paessler

If you open a support ticket, Paessler support might ask you to send logfiles for further analysis. With the **Send Logs to Paessler...** button, PRTG will automatically collect, compress, and send your logfiles to our FTPS server.

SEND LOGS TO PAESSLER	
Name	Enter your name.

SEND LOGS TO PAESSLER

Email	Enter a valid email address. You can provide any of your addresses, but we recommend that you use the email address of your PRTG account, which is entered by default.
Ticket No.	This field is optional. If you have already opened a ticket at Paessler support, please provide the ticket number you received. Your files will then be associated with your ticket automatically. Please enter the ticket number starting with PAE followed by four or more digits, for example, PAE12345. If you do not have a ticket number, leave this field empty.
Configuration	Define if you want to include the configuration file in the data. PRTG will remove all passwords from the config file before sending it to our support team.

Click the **Send** button to start the data upload. Ensure that FTPS and HTTP connections are allowed on this machine.

Part 13

Advanced Topics

13 Advanced Topics

In this section, we cover topics that address more advanced PRTG users. If you already have some experience with PRTG, you might want to learn more about the following topics.

Advanced Topics

- Active Directory Integration 3171
- Application Programming Interface (API) Definition 3174
- Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors 3175
- Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors 3180
- Define IP Ranges 3182
- Define Lookups 3183
- Regular Expressions 3193
- Add Remote Probe 3195
- Failover Cluster Configuration 3212
- Data Storage 3226
- Using Your Own SSL Certificate 3228
- Calculating Percentiles 3194

13.1 Active Directory Integration

PRTG offers a detailed rights management via different user groups. For detailed information please see **User Access Rights** 129.

To make user management easier, you can integrate an existing Active Directory into PRTG in four steps. During this process, you connect an Active Directory (AD) group with a user group in PRTG. All members of your AD group can then log in to PRTG using their AD domain credentials.

You cannot add single AD users to PRTG, but only allow access for entire groups. PRTG automatically creates a user account for each AD user who logs in to PRTG successfully.

This feature is not available in PRTG on demand.

Step 1: Prepare Your Active Directory

- In your Active Directory, ensure users you want to give access to PRTG are member of the same AD group.
- You can also organize users in different groups, for example, one group whose members will have administrator rights within PRTG, and another one whose members will have read-only rights within PRTG.

Step 2: Prepare Your PRTG Server

- Make sure the computer running PRTG is member of the domain you want to integrate it to. You can check this setting in your machine's **System Properties** (for example, **Control Panel | System and Security | System**, click **Change settings** link).

Step 3: Add Domain and Credentials (optional) to System Settings

- In the PRTG web interface 136, open the **System Administration—Core & Probes** 2971 settings.
- In section **Active Directory Integration**, enter the name of your local domain into the **Domain Name** field.
  You can only integrate one AD domain into PRTG.
- Optional: PRTG uses the same Windows user account that you use to run the PRTG Core Server Service. By default, this is the local system Windows user account. If this user does not have sufficient rights to query a list of all existing groups from the Active Directory, provide credentials of a user account with full AD access by using the **Use explicit credentials** option as **Access Type**.
  If you cannot save changes to **Core & Probes** settings because you get an **Error (Bad Request)** with the message **Active Directory Domain not accessible**, change from "local user" to **Use explicit credentials** for **Active Directory Integration** and provide the correct credentials for your domain.
- **Save** your settings.

Step 4: Add a New User Group

- Switch to the **User Groups** tab (see **System Administration—User Groups** 2982).
- Click on the **New User Group** button to add a new PRTG user group.
- In the dialog appearing, enter a meaningful name and set the Use Active Directory setting to **Yes**.
- From the Active Directory Group drop down menu, select the group of your Active Directory whose members will have access to PRTG. If you have a very large Active Directory, you will see an input field instead of a drop down. In this case, you can enter the group name only; PRTG will add the prefix automatically.
- With the New User Type setting, define the access rights 129 a user from the selected Active Directory group will have when logging in to PRTG for the first time. You can choose between **Read/Write User** or **Read Only User** (latter is useful to show data only to a large group of users).
- **Save** your settings.

Done

That's it. All users in this Active Directory group can now log in to PRTG using their AD domain credentials. Their user accounts will use the PRTG security context of the PRTG user group you just created.

Notes and Limitations

- Active Directory users can log on to the web interface 138 using their Windows username and password (please do not enter any domain information in PRTG's **Login Name** field). When such a user logs in, PRTG will automatically create a corresponding local account on the PRTG core server. Credentials are synchronized every hour.
- All requests to the Active Directory servers are cached for one hour, for performance reasons. If a password is changed in the Active Directory, you must either wait for 1 hour or clear the cache manually by clicking on the **Clear Caches** button on the **System Administration—Administrative Tools** 2988 page in the **Setup** 2907 menu).
- By default, there are not set any rights for the new PRTG user group. Initially, users in this group will not see any objects in the PRTG device tree. Edit your device tree object's settings 188 and set access rights for your newly created user group in the **Inherit Access Rights** section.
  The easiest way is to set access rights in the **Root Group Settings** 294.
- PRTG only supports explicit group rights. If your AD uses groups which are member of another group, PRTG will not regard inherited implicit rights of the parent group and therefore refuse login for members of those groups.
- PRTG ignores AD information about Organizational Units (OUs). These values cannot be read by PRTG. However, if you use the AD in an auto-discovery group 251, you can restrict the search to computers which are part of an OU.
- PRTG does not support SSO (single sign-on).
- You can integrate only one AD domain into PRTG.

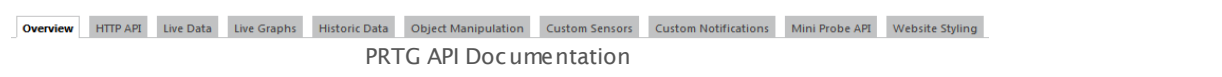
- For very large Active Directories, you will see an input field instead of a drop down when you add or modify a user group. In this case, you can enter the group name only. PRTG will add the prefix automatically.
- A PRTG user account for an AD user is only created if this AD user successfully logs in to PRTG! So if you want to send email notifications 2922 to an AD user group (using the option "Send to User Group" in the notification settings), for example, by choosing the default notification "Email to all members of group [AD group name]", a member of this AD group has to log in to PRTG at least once to be able to receive an email notification. If you want to avoid these single logons of your AD group members to create user accounts, enter the email address of the AD group into the "Send to Email Address" field in the notification settings and choose "None" for the "Send to User Group" option.
- If you want to delete an AD group from PRTG (due to some changes to the AD, for example), you have to delete all users which are in this PRTG user group first. This is because AD users always have this group as their primary group which cannot be changed.
- If you want to reflect changes to your AD in PRTG, you have to delete the AD user group and all members first. Then add the AD group anew. This is because PRTG does not synchronize with your AD automatically.

13.2 Application Programming Interface (API) Definition

The PRTG Application Programming Interface (API) enables you to access monitoring data and manipulate objects using HTTP requests, run your own written sensors and notifications, implement Mini Probes, and customize the web interface.

Detailed HTTP API Documentation

An interactive documentation of the API is integrated into your PRTG installation: Login to the web interface 138 and select **Setup** | **PRTG API** from the main menu.



PRTG API Documentation

In different tabs, the documentation provides information about:

- **HTTP API**: Access monitoring data and manipulate monitoring objects using HTTP requests. This tab includes an interactive query builder that you can use to test your queries. You can find more details about accessing monitoring data and manipulating objects on the tabs **Live Data**, **Live Graphs**, **Historic Data**, and **Object Manipulation**.
- **Custom Sensors**: Create your own sensors for customized monitoring. See also this Knowledge Base article: How can I share my self-written PRTG script/program with other PRTG users?
- **Custom Notifications**: Create your own notifications to send alarms to external systems.
- **Mini Probe API**: Create your own small probes for PRTG on premises to get monitoring data from any platform. For sample usages of the Mini Probe interface, see this Knowledge Base article: Where can I find PRTG Mini Probes which are ready to use?
- **Website Styling**: Customize the look and feel of PRTG on premises by adding your own CSS statements. For sample customizations of the web interface, see this Knowledge Base article: Can you provide sample CSS, JavaScript, HTML for customizing PRTG's web interface?

The documentation that comes with your PRTG installation fits exactly the PRTG version you are using.

13.3 Filter Rules for xFlow, IPFIX and Packet Sniffer Sensors

You can use filter rules for the **Include Filter**, **Exclude Filter**, and **Channel Definition** fields of Packet Sniffer 3097, xFlow, and IPFIX 3099 sensors. The filter rules are based on the following format:

```
field[filter]
```

Valid Fields for All Sensors

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats 3178 below)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats 3178 below)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats 3178 below)
DestinationPort	Any number
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

Additional Fields for Packet Sniffer Sensors Only

FIELD	POSSIBLE FILTER VALUES
MAC	Physical address (see Examples 3178 below)
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, any number

FIELD	POSSIBLE FILTER VALUES
VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

Additional Fields for NetFlow v5 and jFlow v5 Sensors Only

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats 3178 below)
SourceASI	Any number
DestinationASI	Any number

Additional Fields for NetFlow v9 and IPFIX Sensors Only

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number

FIELD	POSSIBLE FILTER VALUES
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats 3178 below)
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in with a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in with a single number (number of contiguous bits).
NextHop	IP address or DNS name (see Valid Data Formats 3178 below)
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

Additional Fields for sFlow Sensors Only

FIELD	POSSIBLE FILTER VALUES
Interface	Any number

FIELD	POSSIBLE FILTER VALUES
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats 3178 below)
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

Valid Data Formats

- IP fields support wildcards (*), range (10-20) and hostmask (/10, /255.255.0.0) syntax, as well as DNS names.
  IPv6 wildcards, IPv6 ranges, and IPv6 hostmasks are not supported.
- Number fields support range (80-88) syntax.
- Protocol and EtherType fields support numbers and a list of predefined constants.

For detailed information on IP ranges, see section **Define IP Ranges** 3182.

Examples

All of the following filter rules are valid examples:

```
SourceIP[10.0.0.1]
SourceIP[10.*.*.*]
SourceIP[10.0.0.0/10]
DestinationIP[10.0.0.120-130]
DestinationPort[80-88]
Protocol[UDP]
MAC[00-60-50-X0-00-01]
DSCP[46]
```

You can create more complex expressions using parentheses **( )** and the words **and**, **or**, or **and not**. For example, this is a valid filter rule:

```
Protocol[TCP] and not (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

13.4 Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors

When adding Custom xFlow sensors, Custom IPFIX 3099, or Custom Packet Sniffing sensors 3097, you have the option to provide a **Channel Definition**. In this field enter your channel definitions using the following syntax (one entry per channel):

```
#<id>:<Name>
<Rule>
```

Syntax

- The **<id>** needs to be 1 or a higher number and must be unique for the sensor. This means each channel definition must have a unique ID.
  The maximum channel ID you can use is 2147483648 (2^31). Higher IDs are not supported. We recommend that you use channel IDs like 1, 2, 3, and so on.
- The **<id>** is linked to the historic data.
  As soon as you change the ID, you will loose the history for this particular channel that the ID was linked to.
- One rule can span multiple lines.
- The next rule starts with a # as first character in a line.
- The **<name>** is the channel's display name.
- The rules are processed top to bottom (the number does not matter) and the data is accounted to the first match.
- PRTG adds one channel named **Other** automatically. This channel counts all traffic for which you have not defined a channel.
- After the name you can use an optional **[<unit>]** to override the automatic unit which is based on the source sensors.

The **<Rule>** syntax is identical to the one described in the Filter Rules for xFlow and Packet Sniffer Sensors 3175 section. Because data is accounted to the first match, make sure you start with the most specific rule at the top and get less specific to the bottom.

We recommend that you write the rules list in an external editor first and then paste it into the **Channel Definition** field of the sensor in PRTG. Otherwise, if the rules contain an error, the entries will be removed when you add the rules in case!

Example

General example:

```
#5:HTTP
Protocol[TCP] and
(SourcePort[80] or DestinationPort[80] or SourcePort[8080] or
DestinationPort[8080])
```

Channel definition example for differentiating by protocol:

```
#1:TCP
Protocol[TCP]

#2:UDP
Protocol[UDP]

#3:ICMP
Protocol[ICMP]
```

13.5 Define IP Ranges

In some setting fields, you can either enter a host name or single IP address, or you can define IP ranges. PRTG follows a common syntax for this. IP ranges are available, for example, for xFlow and Packet Sniffer sensors 386 and for probe connection settings 2968.

For the supported syntax of the automatic network discovery functionality in PRTG, see section **Auto-Discovery** 252 (**IP Selection Method**).

Available Options

OPTION	DESCRIPTION	SYNTAX	EXAMPLE(S)
Simple	Enter a fixed IP address.	a.b.c.d	10.0.10.9
Hostname	Enter a hostname. PRTG will resolve it to an IP address in your network.	hostname	device-xyz
Hostmask	Enter a hostmask. A hostmask defines the relevant bits of the IP address.	a.b.c.d/h or a.b.c.d/e.f.g.h	10.0.0.0/255
Range	Enter an IP address range. Replace each of **a**, **b**, **c**, **d** by either ▪ * (asterisk) for any value; corresponds to 0-255 —or— ▪ **x-y** for any range between 0 and 255.	a.b.c.d	10.0.0.1-20 or 10.*.0.* or 10.0.0-50.*

13.6 Define Lookups

PRTG uses **lookups** for some sensor types and for some sensors with custom channels. In general, lookups make data more human friendly because they map status values as returned by a device (usually integers) to more informative expressions in words that show you the status of a monitored device as a clear message.

Additionally, lookups can also define the sensor status [163] that will be shown in correlation with certain status codes, just like sensor channel limits [2783] can define a sensor status, too. For example, for a printer, PRTG can show a sensor in a yellow **Warning** [163] status with channel values, provided by lookups, like "Toner Low" instead of simple status codes, like "1".

You can customize lookups individually and define your own texts that a sensor channel can show. See the section **Customizing Lookups** [3188] below.

If a channel uses lookups, we strongly recommend that you control the sensor status only via the lookup definition and not use channel limits! See also section **Sensor Channels Settings** [2783].

Lookups do not change data in the PRTG database, but they merely change the way sensor channels are shown. Any change to lookup definition files will apply to historic data as well as to live data.

Some exceptions apply to the **SNMP Custom String Lookup Sensor** [1679] that basically does an "inverse lookup". It does not map an integer to a text message but looks only for matching strings in the lookup definition and shows a status based on this text value.

Customizing lookups is not possible for PRTG on demand instances.

Requirement: Channel Unit "Custom"

All sensor channels with enabled **Value Lookup** need to use the channel **Unit** "Custom". For details, refer to the section **Sensor Channels Settings** [2783].

There are sensors that provide the unit **Value Lookup** for channels in their sensor settings. Do not use the "custom" unit for channels of these sensors if you want to use lookups! This would result in malfunctioning lookup channels. For the following sensor types, choose the unit **Value Lookup** in the sensor settings and select your lookup file directly when adding the sensor:

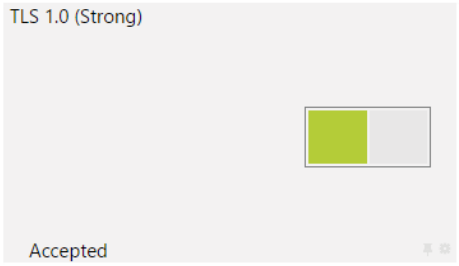
- **Google Analytics Sensor** [827]
- **Microsoft SQL v2 Sensor** [1135]
- **MySQL v2 Sensor** [1151]
- **Oracle SQL v2 Sensor** [1253]
- **PostgreSQL Sensor** [1363]
- **SNMP Custom Advanced Sensor** [1658]
- **SNMP Custom Table Sensor** [1689]

Visualization of Lookup Channels

PRTG can display gauges or switches for channels which use lookups. We recommend that you stay below 120 lookup values to display informative gauges for primary channels. Non-primary channels have an upper limit of around 40 lookup values for gauges.

The various states displayed in gauges always follow the clockwise order **Up** (green) < **Warning** (yellow) < **Down** (red) < **Unknown** (Gray / Black).

A Gauge Showing the Status of a Lookup Channel



A Switch Showing the Status of a Boolean Lookup Channel

Lookups Directory and Format

Lookups are defined in XML format in files ending in **.ovl**. PRTG's standard lookup files are located in the PRTG program directory 3226 in the **\lookups** subfolder. These files are maintained by PRTG itself. In each of the files lookups are defined for one or more sensors. Furthermore, the lookups folder contains the **\custom** subfolder to store your customized lookups.

The files follow a basic principle. For each numeric value you can define:

- A message that the sensor will look up and show instead of the numerical value
- The status that the sensor will show

Use the **SNMP Custom String Lookup Sensor** 1679 to map a string into a corresponding status. Please use the lookup type 3190 **SingleInt** for this purpose.

You cannot access this directory on PRTG on demand instances.

Example

The following code illustrates the lookup definition for the toner status of the **SNMP HP LaserJet Hardware** 1791 sensor:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1" xmlns:xsi="http://www.w3.org/2001/X
       <Lookups>
              <SingleInt state="Ok" value="0">Toner Okay</SingleInt>
              <SingleInt state="Warning" value="1">Toner Low</SingleInt>
              <SingleInt state="Error" value="2">No Toner Cartridge Loaded</SingleInt>
       </Lookups>
</ValueLookup>
```

The schema in the example provides an insight how lookups are defined:

- The **<?xml>** tag in the first line defines the content as XML.
- The **<ValueLookup>** tag in the second line contains:
  - The **ID** which is shown in the **Sensor Channels Settings** 2782.
  - The **desiredValue** 3189 attribute contains the value which is used for the calculation of the "Coverage". In this example, **1** is defined as desired value.
  - The **xsi** attributes refer to PRTG's predefined XML schema definitions (which allow easy editing of lookup files with supported editors). We recommend that you use the default value.
- Between the tags **<Lookups>** and **</Lookups>** the particular lookups for the sensor data are defined:
  - A lookup entry starts with a tag containing the type of the status value, the lookup type (in this example, this is always **<SingleInt>**).
  - Separated by whitespace, the **state** attribute defines the status the sensor will show. Allowed values are: **Ok**, **Warning**, **Error**, and **None** ("None" does not trigger a status change).
  - The **value** attribute defines which numeric value will trigger the lookup. This is the value that PRTG will receive from the device.
  - The **text** defines the substitution text that is shown instead of the value. For example, this can be a status message.
- The same way all other possible lookups are defined. The lookup definitions are closed by the tag **</Lookups>**. The file closes with **</ValueLookup>**.

In our example, the lookup file will have the following effect:

Value as Reported from HP Printer	Value Shown in PRTG (Sensor Channel)	Sensor Status Shown by PRTG
0	Toner Okay	Up
1	Toner Low	Warning
2	No Toner Cartridge Loaded	Down

The XML Schema

An exemplary schema of the XML files containing the lookup definitions can be sketched like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="..." desiredValue="..." undefinedState="..." xmlns="..." xsi="...">
	<Lookups>
		<SingleInt state="..." value="...">status text</SingleInt>
		<Boolean state="..." value="...">status text</Boolean>
		<BitField state="..." value="...">status text</BitField>
		<Range state="..." from="..." to="...">status text</Range>
		[several other lookup definitions]
	</Lookups>
</ValueLookup>
```

Element	Description	Attributes, Value Assignment, and Content
<?xml> content	This is the XML declaration. Every XML file begins with it.	▪ **version** and **encoding** are "1.0" resp. "UTF-8" ▪ content: **<ValueLookup>**contentValueLookup**</ValueLookup>**
<ValueLookup> contentValueLookup **</ValueLookup>**	Defines the **ID** of the channel, what **desiredValue** is used, the status for undefined values (**undefinedState**), and links to PRTG's predefined schema definitions, which allow editing of lookup files with supported editors.	▪ **id**: Specifies how the name of the lookup file is shown in the **Sensor Channels Settings** 2782. ▪ **desiredValue** 3189: Please see below. ▪ **undefinedState**: Optionally define a status for values that are not defined in the lookup file. If the target device returns a value that is not included in the lookup definition, the sensor will show this status (**Ok**, **Warning**, **Error**, or **None**) with an according message. Without a definition of "undefinedState", the sensor will only show the returned value. ▪ **xmlns:xsi/xsi**: refers to predefined XML schema definition ▪ contentValueLookup: lookup definitions **<Lookups>**contentLookups**</Lookups>**
<Lookups> contentLookups **</Lookups>**	Defines the particular lookups for the sensor data.	▪ contentLookups: one or more lookup entries, see below
<SingleInt> status text **</SingleInt>** **<Boolean>** status text **</Boolean>** **<BitField>** status text **</BitField>** **<Range>** status text	Each element defines one lookup entry. There can be one or more entries in this format. SingleInt, Boolean, BitField, and Range are lookup types 3190.	▪ **state**: defines the state the sensor will show; allowed values: **Ok**, **Warning**, **Error**, **None** ▪ **value**: defines the value which triggers the lookup. Please enter an integer value. **Range** needs always both values "from" and "to". ▪ status text: defines a **status text** that will be used as substitution text and shown instead the integer value. For

Because all the XML files containing lookup definitions are delivered in a pre-given schema as indicated above, you can customize lookups accordingly.

Customizing Lookups

If you want to change the status definitions of a specific sensor channel, you basically have to do the following:

1) Find out the (file) name of the lookup file in the settings of the sensor channel 2782 you want to change the behavior for.

2) From the PRTG program directory 3226 subfolder **\lookups**, copy this file into the **\lookups \custom** subfolder (ensure you do not change the file name!).

3) Change the duplicated file as you like. See the example below.

This feature is not available in PRTG on demand.

All default lookup files are located in the **\lookups** subfolder in the PRTG program directory 3226. To customize existing lookups, copy the desired lookup file from the lookups folder to the **\lookups\custom** subfolder or create a new .ovl file there. When using the same ID in the ValueLookup tag, the files in the **\lookups\custom** folder will have a higher priority than the original files in the **\lookups** folder. This way, PRTG handles your customizations preferably instead of the original lookup settings. If you want to use custom lookup definitions in addition to the existing lookups, define a new ID in the lookup file which is not used by another lookup file. PRTG identifies lookup definitions via this ID, it does not use the file name.

Open the file with an XML or text editor and adjust the lookups to your personal preferences. You can define your own messages as well as you can customize sensor states for the particular return values. For example, if you do not want show an "Error" (a sensor **Down** status) for the return value "2" but only a warning, then you can replace "Error" with "Warning".

The possible states are given in the **LookupState.xsd** file in the custom directory. Following the schema of the XML files that are delivered with PRTG enables you to edit the lookups in a safe way.

If you imported an oidlib file 1915 that contains lookups 3183 (you can see this in section **Lookup** in the MIB Importer), you can define your own sensor states for returning values. If you add an **SNMP Library Sensor** 1912 using this oidlib, PRTG will create a lookup definition file using the **lookupname** of the chosen library as **id** parameter. Override this lookup definition with your own custom lookup as described in this section. This is important because lookups that are added via an oidlib will not contain any state definitions and result in a **Warning** status 163 of the sensor by default because of the entry undefinedState="Warning".

If you use an **SNMP Custom String Lookup Sensor** 1679, you can create a new custom lookup definition in the **\lookups\custom** directory with the expected return values. In this case, use the **lookupname** of the chosen library as **id** parameter to override the lookups from the oidlib file.

When you save an edited lookup, make sure that it is saved as an .ovl file. Otherwise, the lookup might accidentally be saved as a .txt file and might not be loaded.

Example for Lookups Customization

For example (just for illustration purposes), imagine you would like

1) to have the status "Warning" for all undefined values that the target device might return,

2) to change the status for the return value "2" from "Down" to "Warning",

3) and to add the status "None" to the example 3185 above.

Then do the following:

- Copy the file oid.paessler.hplaserjet.tonerstatus to the **\lookups\custom** subfolder of your PRTG installation.
- Open this file with an editor.
- Leave the ID value unchanged to prioritize the customized lookup to the original file.
- Insert the status definition for undefined values into the ValueLookup element: undefinedState="Warning"
- Replace "Error" with "Warning" for value "2".
- Add a a "SingleInt" element with status "None" for the (hypothetical) return value "3".
- Save the file and reload 3192 the custom lookup folder in PRTG.

The customized lookup file will finally look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1" undefinedState="Warning" xmlns:xsi=
       <Lookups>
              <SingleInt state="Ok" value="0">Toner Okay</SingleInt>
              <SingleInt state="Warning" value="1">Toner Low</SingleInt>
              <SingleInt state="Warning" value="2">No Toner Cartridge Loaded</SingleInt>
              <SingleInt state="None" value="3">Unknown status of toner</SingleInt>
       </Lookups>
</ValueLookup>
```

See also **SNMP Custom String Lookup Sensor—Example** 1686 for a lookup definition that maps a string value to a sensor status.

desiredValue Attribute

It is necessary to define a **desiredValue** in the lookup files. The desiredValue corresponds to a status value triggering a lookup. PRTG calculates the percentage of time this specific state has been monitored. The result is displayed for all data tables and graphs that show averaged values.

Considering the example above where the desiredValue is "1", PRTG will calculate the percentage of time the toner status has been "Warning". If in a time span of five minutes four of five sensor scans returned a "Warning" status, PRTG would show an average of 80% for this time span, because in 80% of the time the sensor showed a "Warning".

Lookup Types: SingleInt, Boolean, BitField, Range

Besides the lookup type **SingleInt** as seen above, there are three other lookup types: **Boolean**, **BitField** and **Range**. Using these types you can define lookup values beyond simple integers.

Lookup Type	Description	Syntax
SingleInt	Uses an **integer** to define a lookup for one status value.	value="int" Only signed 32-bit integers are supported.
Boolean	Uses **0** or **1** to define a lookup for two different status values.	value="0" value="1"
BitField	Uses a **bitfield** for multiple status values.	Only use it if you have basic knowledge about bitmasks. Please see the section **More** 3192 below for a general introduction. Every value has to equal a power of two (for example, 1, 2, 4, 8, 16, 32, 64, etc.). The **SNMP Custom String Lookup Sensor** 1679 does not support BitFields.
Range	Uses an inter range **from-to** to define a lookup for several status values.	from="int" to="int" Using ranges, the parameters "from" and "to" always have to be defined. If you want to query only one single value in a range file, this value must be set as parameter for "from" **and** "to" (for example, from="2" to="2"). The **SNMP Custom String Lookup Sensor** 1679 does not support ranges. Only signed 32-bit integers are supported.

You can use only **one** kind of lookup type in **one** lookup file. This means, only or SingleInts, or Boolean, or BitField, or Ranges. Different lookup types in one file are not allowed.

Define Lookup Files in Sensor Channel Settings

For each sensor with a custom channel, you can define a lookup file to use with the option **Value Lookup** in the sensor channel settings 2782. This option is visible for many **SNMP sensors**, some **application sensors**, and always for the following sensor types:

- **EXE/Script Sensor** 747
- **EXE/Script Advanced Sensor** 759 (if a **Custom** unit is defined)
- **SNMP Custom Sensor** 1649

For details, see section **Sensor Channel Settings** 2782.

Loading Lookups

You can (re)load the defined lookups in the custom folder by clicking the **Load Lookups** button in the PRTG web interface under **Setup | System Administration | Administrative Tools** 2987.

A sensor whose lookup file you have modified and reloaded will not re-evaluate this lookup before the next sensor scan. For sensors with large scanning intervals, use the **Check Now** option from the context menu 226 to immediately apply the new lookup definition and to avoid an incorrect sensor status.

Debugging—What will happen if...?

- A return value is defined in the lookups that never will be returned by a device because the value is not assigned: The value will never be triggered, so PRTG simply ignores this entry.
- PRTG receives a return value that is not defined for lookups: No substitution message can be found. PRTG will just show the return value. You can optionally define a status for unknown values with a definition of **undefinedState** in the **ValueLookup** element (see section **Define Lookups—The XML Schema** 3186 above).
- Different lookup types are in one lookup file: This is not allowed and PRTG will discard this lookup definition. If you use miscellaneous lookup types in one file, for example, ranges and singleInts together, the PRTG system will create a ticket when loading lookups or restarting the PRTG server with the following error message: Value lookup file "[...]" could not be loaded ("" is not a valid integer value)".
- Incorrect XML code: PRTG will create a new ticket when loading lookups or restarting the PRTG server with a corresponding error message and discard this lookups definition.
- A lookup file has a file ending other than .ovl: The file will not be loaded.

- http://en.wikipedia.org/wiki/Bit_mask

13.7 Regular Expressions

For some sensors (for example, some HTTP sensors 386 and email sensors 391), you can use regular expressions to match a search pattern. PRTG suppors PCRE-RegEx. See below for examples with the most common patterns.

Common Search Patterns

Find matches containing the word **error** or **alarm**:

```
\b(error|alarm)\b
```

Find matches containing the words **error** and **alarm** in any order:

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

Find matches containing all of the words **tree**, **flower**, **leaf**, and **bug**, in any order:

```
(?=.*\btree\b)(?=.*\bflower\b)(?=.*\bleaf\b)(?=.*\bbug\b).*
```

It is not possible to match an empty string using the PRTG regex search with sensors.

Example

The search pattern

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

will match the following expressions:

- alarm error
- error alarm
- I am an error and I evoke an alarm
- I am an alarm and I indicate an error
- An alarm combined with an error indeed!
- An error combined with an alarm, too!

13.8 Calculating Percentiles

PRTG not only monitors your network and informs you in the case of issues that are worth you taking a closer look at in the here and now. PRTG also stores a lot of historic measurement data gathered from your sensors. This means that you have a great base for statistical analysis and evaluation of what is and was happening in your network.

When creating a **Report** 2862 with PRTG, you get raw data, sums, averages and percentages of your monitoring data.

Additionally, PRTG also offers percentile calculation. This statistical method puts your data in order, for example, from the lowest value to the highest value, and calculates the percentile you want, optimally informing you about the distribution of your network relevant data.

For example, if you request the 95th percentile, you know that 95 percent of the measured data is below a certain value, and thanks to PRTG, you know what this certain value is.

If applied, for example, to bandwidth, you know what values you are talking about when talking about the 5 percent of unusually high bandwidth consumption and which value your users do not exceed 95 percent of the time. Service providers often use percentiles to offer a fairer billing that excludes infrequent usage peaks.

If you want to know more about the formula that PRTG uses for percentile calculation, see this Knowledge Base article: What are percentiles and what differences do they make in PRTG reports?

Create a report for several sensors and device groups using the **Report** 2862 feature or create reports for single sensors using the **Historic Data Reports** 175.

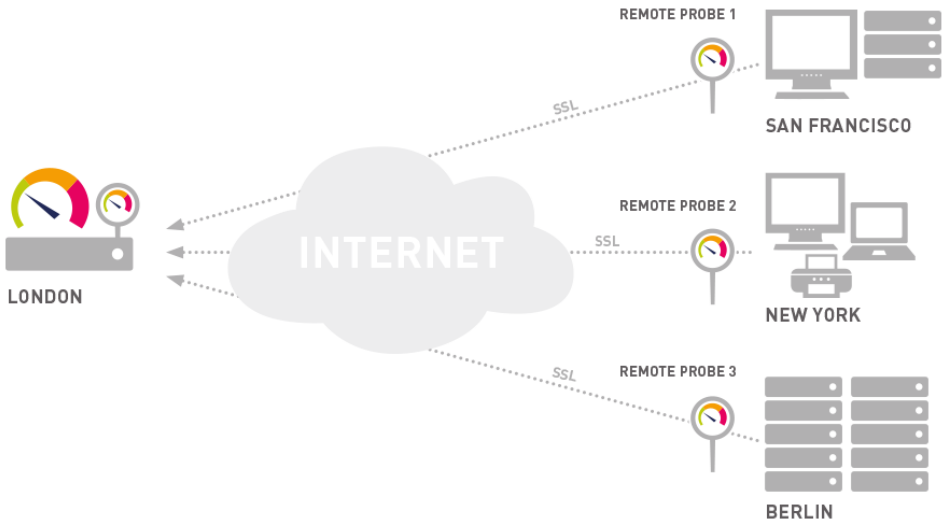
- https://kb.paessler.com/en/topic/9563

13.9 Add Remote Probe

You can extend your monitoring by installing one or more **Remote Probes**[3196]. A remote probe installation is required to monitor your local network with a PRTG on demand instance. Remote probes also allow you to monitor different sub-networks that are separated by a firewall from your PRTG on premises core server, to keep an eye on remote locations, and are useful in several other scenarios.



Monitoring Remote Locations via Remote Probes

Click here to enlarge: http://media.paessler.com/prtg-screenshots/monitoring-remote-locations-via-remote-probes.png

Extend Your Monitoring Now

Installing remote probes is easy—you can do it within a few minutes. Please see the sections linked below for further instructions.

- Background: **Remote Probes and Multiple Probes**[3196]
- Installing: **Remote Probe Quick Install**[3199]
- Step by Step: **Remote Probe Setup**[3206]

More

Video Tutorial: Core Server and Remote Probes

- https://www.paessler.com/support/video_tutorials/distributed_monitoring

13.9.1 Remote Probes and Multiple Probes

Upon installation, PRTG creates the first probe automatically, called the **Local Probe**. It runs on the same machine as the PRTG core server and monitors all devices from this system, using the sensors you have configured.

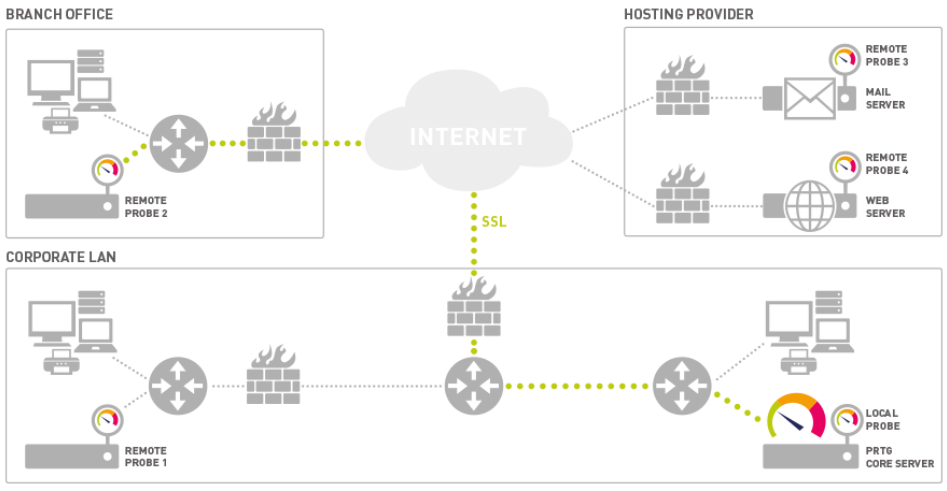
Working with only one local probe should suffice for Local Area Network (LAN) monitoring with PRTG on premises and if you want to monitor one location only. For LAN monitoring with PRTG on demand, at least one remote probe is required.

Scenarios Requiring Remote Probes

There are several situations that make it necessary to work with **Remote Probes** in the same LAN or in remote locations. Among these situations are the following:

- You run a PRTG on demand instance and want to monitor your local network.
- You have more than one location and you need to make sure that services are available from all locations.
- Your network is separated in several LANs by firewalls, and the local probe cannot monitor specific services across the firewalls.
- You want to monitor systems in a secure network, and you need a secure connection between the PRTG server and this network.
- You want to sniff packets on another computer.
- You want to monitor NetFlow data on another computer.
- You experience performance issues with CPU intensive sensors like packet sniffer or NetFlow sensors and need to distribute the load over more than one PC.

The following chart shows an example for a remote probe scenario.



Monitoring a Distrubuted Network with PRTG

Click here to enlarge: http://media.paessler.com/prtg-screenshots/remote_probes_en.png

The PRTG core server inside the Corporate LAN (bottom right) is able to monitor:

- Services inside the Corporate LAN using the **Local Probe**.
- Services behind a firewall in the Corporate LAN using **Remote Probe 1**.
- Secured services inside the Branch Office (top left) using **Remote Probe 2**.
- Secured services on Mail Server and Web Server using **Remote Probe 3** and **Remote Probe 4** installed directly on these servers.
- Public services on the internet using any of the probes.

How Probes Work

As soon as a probe is started, it automatically connects to the PRTG core server 112, downloads the sensor configuration, and begins its monitoring tasks. The core server sends new configuration data to a probe as soon as the monitoring configuration is changed by the user. Probes monitor autonomously and send the monitoring results back to the core server for each check they have performed.

If the connections between core and probe fail for any reason (for example, a reboot of the computer running the core server) the probe continues monitoring and stores the results. During a connection loss a buffer stores a maximum of 500,000 sensor results in the RAM memory of the remote probe system (up to 50 - 200 MB). This means that for 100 sensors with one minute interval the monitoring results of up to 3 days can be buffered (or 52 minutes for 10,000 sensors with one minute interval). The probe automatically reconnects to the core as soon as it is available again and transmits all monitoring results gathered during the connection loss.

The connection between probe and core is initiated by the probe, secured using Transport Layer Security (TLS). This means that the data sent back and forth between core and probe is not visible to someone capturing data packets. The core server provides an open TCP/IP port and waits for connection attempts from probes. If a new probe connects for the first time, the administrator will receive a ToDo ticket 200 and will then see the new probe in the device tree.

As a security precaution, the probe must be manually acknowledged by the administrator in the device tree before any sensors can be created and monitored. The administrator can also deny a probe which will then be disconnected. No further connection attempts will be accepted and the probe IP is added to the **Deny IPs** list in the probes system settings (see **System Administration—Core & Probes** 2967 section). This ensures that unauthorized probes cannot connect to a core server.

Because the probe initiates the connection, you must ensure that a connection can be established from the outside world to your core server. For example, you may need to open any necessary ports in your firewall and you may need to specify a Network Address Translation (NAT) rule for your network. The process is the same as if you wanted to allow access to the web server provided by the PRTG core server via port 443, for example. Usually it is sufficient to open or forward TCP port 23560 (default) on the machine that runs the core server; on probe side it is not necessary to open any port in most cases.

If you run PRTG in a cluster installation, remote probes also connect to your failover node(s) in addition to the master node and send monitoring data. This works as described above for a single PRTG server. If your master node fails, you can still see monitoring data on your failover (s). You can define the **Cluster Connectivity** of each probe in its **Administrative Probe Settings** 330.

Automatic Probe Update

Whenever a new version of PRTG is installed on the core server, all remote probes will automatically download and install the updated version of the probe as soon as they reconnect to the updated core installation.

The local probe has already been updated during the core installation. All remote probes automatically download the new binaries using the TLS-secured probe or core connection. The download of the 4 MB file takes anywhere from a few seconds (in a LAN) to a few minutes (via internet connections), depending on the available bandwidth. As soon as the update has been downloaded the probe disconnects, installs the update, and reconnects to the core server. This takes between 20 and 100 seconds. Please note that during the update phase the monitoring of the local probe can be affected due to the bandwidth required for the downloads.

If the automatic update of a remote probe fails for some reason, please update the remote probe manually by downloading and executing the installer 3206 on the probe computer. If a remote probe keeps being disconnected after an update, please check if the server with the remote probe has two network connections with different IP addresses. Make sure these addresses are in the list of allowed IPs in the Core & Probes settings 2968.

Video Tutorial: Core Server and Remote Probes

- https://www.paessler.com/support/video_tutorials/distributed_monitoring

13.9.2 Remote Probe Quick Setup

Install a PRTG Remote Probe directly by right-clicking on a device in the PRTG device tree. This semi-automatic installation mechanism is an alternative to the **Remote Probe Setup Using Installer** 3206.

This is an experimental feature. It may not work in all situations. In this case, please see Debugging 3204 and try the standard remote probe installation 93.

This feature is not available in PRTG on demand.

To install a Remote Probe directly from the device tree in the PRTG web interface, follow the steps below.

- Step 1: Meet the Requirements 3199
- Step 2: Prepare the Core Server 3200
- Step 3: Provide Credentials 3202
- Step 4: Install the Remote Probe 3202
- Step 5: Approve the New Remote Probe 3204

Before you start, take a closer look at the requirements in the first three steps.

Do you run PRTG Network Monitor in a cluster? Then mind this important note 3208.

Step 1: Meet the Requirements

To install a probe remotely on a computer please ensure that the following conditions are true.

- The target computer runs the operating system Windows 7 or later.
- The target computer is accessible through Remote Procedure Call (RPC). This is usually the case when your PRTG server and the target computer are located in the same LAN segment. Otherwise, open Windows services.msc on the target computer and start the Remote Procedure Call (RPC) service.
- Programs are allowed to communicate through your Windows Firewall. Open the settings of your Firewall and choose **Allow programs to communicate through Windows Firewall**. Mark the checkbox for **Remote Service Management**, and the checkbox **Public** in the corresponding line.
- Connections between remote probes and the PRTG core server require port 23560. Please open or forward this port in your firewall configuration.

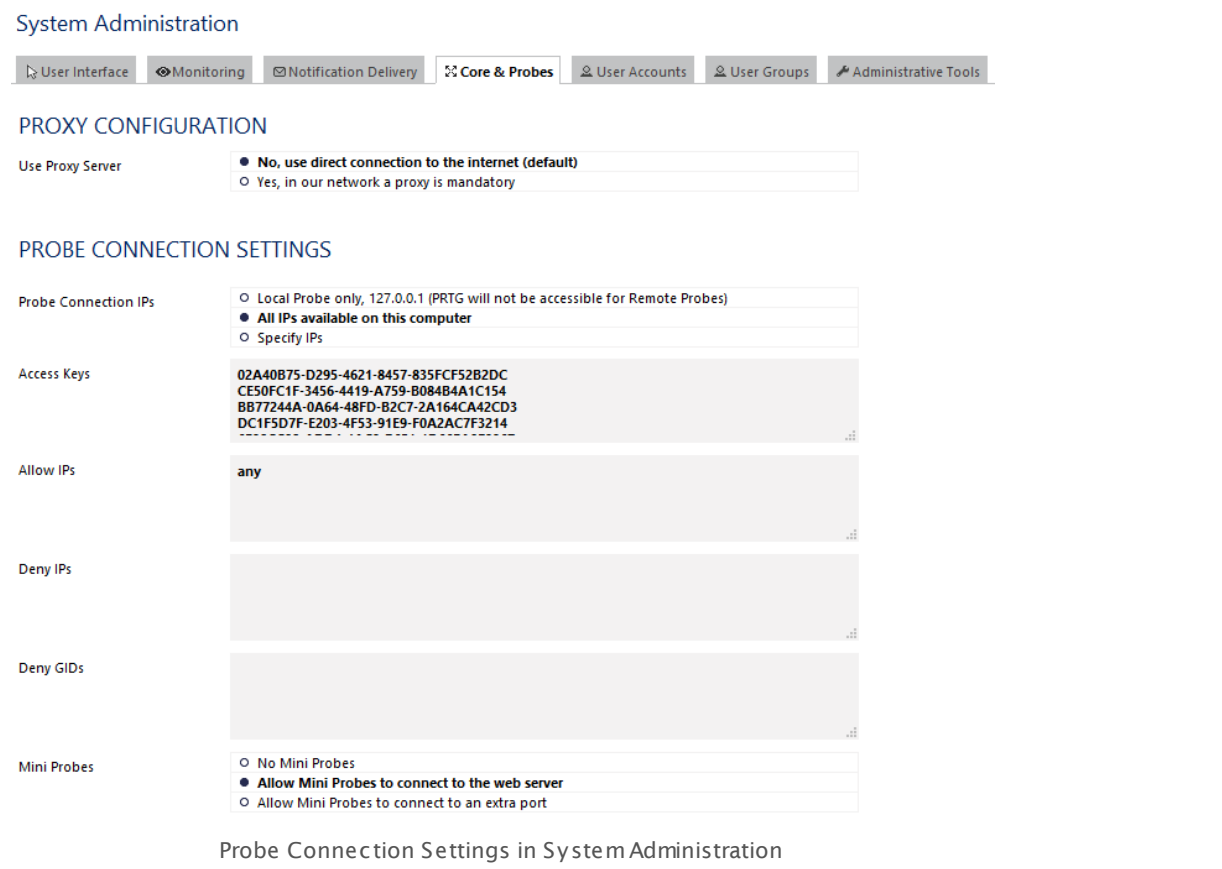
You cannot install a remote probe on the local probe device and the Remote Probe Quick Setup is also not available for devices on remote probes. Please use the Remote Probe Installer 3206.

You cannot install a remote probe on the computer the PRTG core server runs on because the core server already includes a local probe service.

Step 2: Prepare the Core Server

Because your remote probe needs to connect to your PRTG core server, your PRTG core server needs to accept incoming remote probe connections. So, please prepare your PRTG core server first.

Edit the relevant settings in System Administration—Core & Probes 2967. From the main menu in the PRTG web interface 138, select **Setup | System Administration | Core & Probes** to access the probes settings and go to the **Probe Connection Settings**.



Probe Connection Settings in System Administration

By default, a core server accepts connections from the **Local Probe only** (IP address 127.0.0.1). This setting is the most secure setting, but it does not allow any remote probe to connect to your PRTG core server.

To accept remote probes, choose one of the following settings:

- **All IPs available on this computer**: Any IP on your core server system accepts incoming probe connections.
- **Specify IPs**: Specify selected IP addresses that accept incoming connections.

Other settings are:

- In the **Access Keys** field, you can enter a new access key that can be used for a core probe connection. The access key can include arbitrary signs and have arbitrary length. During the remote probe install process PRTG will add an access key automatically, so usually you will not have to define a key here.
- In the **Allow IPs** field, you can enter the IP address of the computer you want to install a remote probe on. To make things easier, you can also enter the word **any:** this will set the core server to accept remote probes connecting from any IP address.
  If you use **any**, make sure you write the word in lower case only! Any other variations will not be valid!
- In the **Deny IPs** field, you can enter the IP address of the computers that you do not want to connect to the PRTG core server.
- In the **Deny GIDs** field, you can enter the global ID (GID) of a device in your network that you do not want to connect to the PRTG core server. Future probe connections from this device will be denied automatically.
  What is a global ID (GID)? It is the ID that PRTG Network Monitor attributes to every device that you include in your monitoring.

When you are done, click **Save** to save your settings. If you click **Cancel**, all changes to the core and probe settings will be discarded.

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the **Enterprise Console** 3028, or of **PRTG Apps for Mobile Network Monitoring** 3082 will be disconnected and reconnected.

For further information about the core probe connection settings, see also the **System Administration—Core & Probes** 2967 section.

To edit the core probe connection settings you can also use the **PRTG Administration Tool** 3135 on your core server.

PRTG Cluster and Remote Probes Outside the LAN

If you use the **Clustering** 116 feature of PRTG and you want to run remote probes outside your local network, you have to make sure your cluster nodes and the addresses they use are reachable from the outside! Check your cluster node settings under **System Administration—Cluster** 2992 before installing a remote probe outside your local network. Enter addresses (DNS names or IPs) which are valid for both cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

If you already have a remote probe installed outside your LAN and the probe is disconnected because of this, please follow these steps:

1. Uninstall the current remote probe.
2. Update the cluster node settings 2992 with addresses that are reachable from outside your LAN.

3. Restart your PRTG core servers.
4. Install the remote probe again. It will then obtain the IP address or DNS name entries that it can reach.

See also section **Failover Cluster Configuration—Remote Probes in Cluster** 3215.

Step 3: Provide Credentials

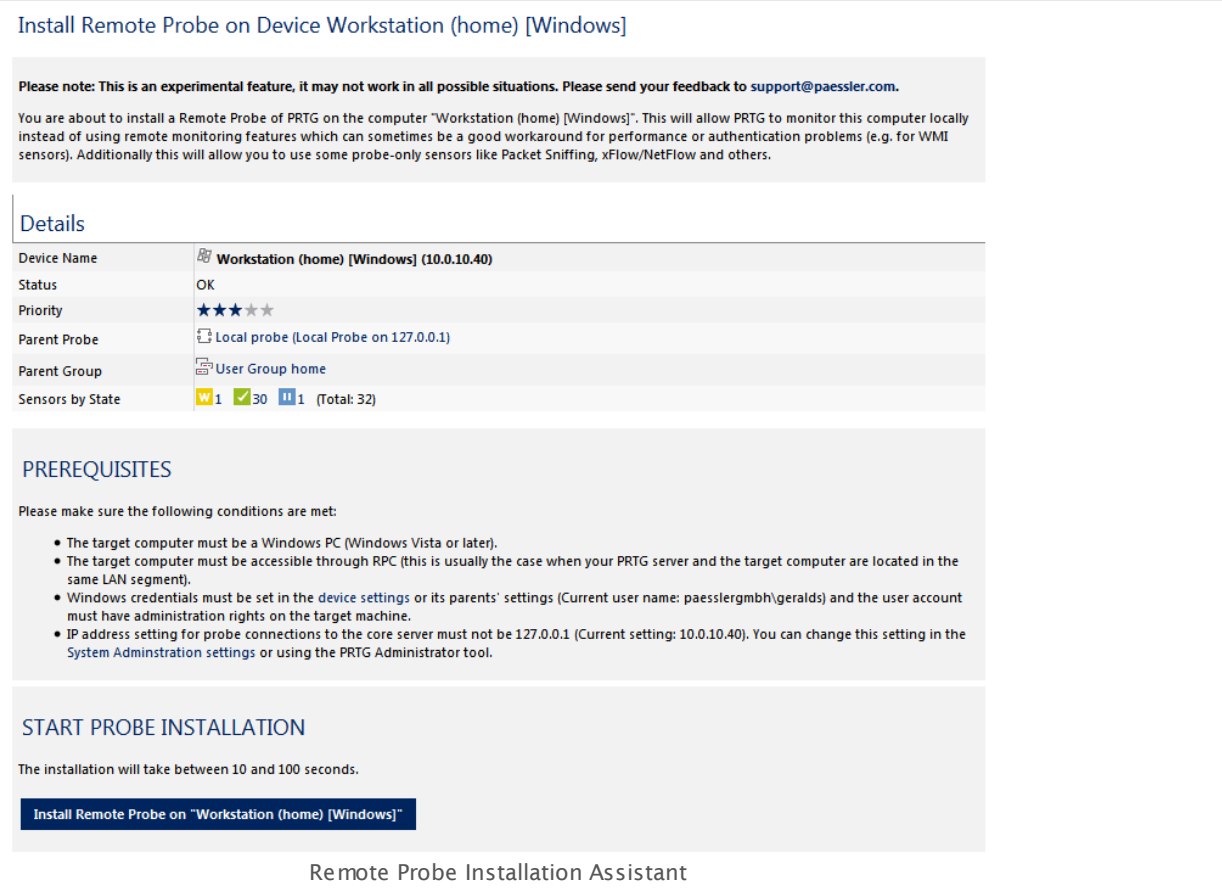
If not done yet, add a device 360 to PRTG that represents the target computer on which you want to install the remote probe. Set the correct Windows credentials for this device.

- Open the **Device Settings** 360.
- In the **Credentials for Windows Systems** section, provide **Domain or Computer Name**, **User**, and **Password** for the target computer.
- You can also inherit 122 the credentials from the settings of a parent object in the device tree.

Make sure this user account has administration rights on the target computer.

Step 4: Install the Remote Probe

- In the device tree overview, open the context menu 222 of the target device.
- Choose **Device Tools | Install Remote Probe...**.
  This option is only available on devices on the PRTG on premises local probe.
- The install assistant will appear on a new page.

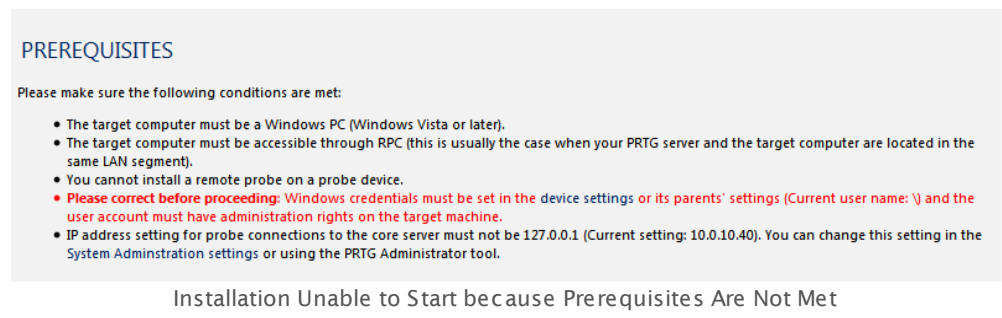


Remote Probe Installation Assistant

The installation assistant is divided into four sections:

- Experimental feature notice and short introduction
- **Details**: Overview about the device: name, status, priority, parent probe, parent group, and sensor states in place with their number
- **Prerequisites**: For details, see Step 1 3199.
- **Start Probe Installation**: Time estimation for installation and installation start button

Make sure you meet the following requirements. If not, PRTG cannot start the installation process. Open requirements are highlighted in red.



Installation Unable to Start because Prerequisites Are Not Met

If everything is okay you can install the remote probe on the target computer by clicking the button **Install Remote Probe on "[device name]"**. Wait until the process has ended.

If the installation was successful, the following message will appear in the **Start Probe Installation** section: **Done. Result is: OK**.

Every time you start an installation, PRTG automatically adds a new key to **Access Keys** in **System Administration—Core & Probes** 2967, no matter if the installation has been successful or not.

Step 5: Approve the New Remote Probe

If the installation was successful, you will receive further instructions after the result message. As indicated, go back to the device tree 151 and acknowledge the new probe. The approval button will appear under the node of the new remote probe. You will also receive a new ToDo ticket 201.

Click **Approve and auto-discover new probe** to acknowledge the created remote probe and instantly start an **Auto-Discovery** 249 in this network. Click **Approve new probe** to acknowledge the remote probe without running an auto-discovery. You can also discard the probe by clicking **Deny new probe**.

When denying or removing a remote probe, this device's global ID (GID) will be included into **Deny GIDs** in **System Administration—Core & Probes** 2967. Future probe connections from this device will be denied automatically.

Denying the remote probe in the PRTG device tree does not uninstall the probe, but only denies access to the core server. The probe will continue to run on the target system until you uninstall it manually.

After approving, the approval button will turn into a **Working** status. Please wait while the probe connects. Once approved, PRTG automatically creates a set of sensors for the probe to ensure that bottle-necks on the probe will always be noticed. We recommend that you keep these sensors. Now you can create groups, devices and sensors to customize your monitoring via the new probe.

Debugging

- Please note that installing a remote probe directly from the device tree in the PRTG web interface is an experimental feature. It may be the case that this approach is not possible in all situations.
- Please follow the steps of this chapter closely when encountering problems with the Remote Probe Quick Install. Especially consider the conditions as described in Step 1 3199 of this section like Windows Firewall settings.
- If the quick installation procedure described in this section does not work with your setup, please install your remote probes manually and see how to do so in **Remote Probe Setup Using Installer** 3206.

More

Knowledge Base: How can I customize PRTG's ports for core-probe-connections?

- https://kb.paessler.com/en/topic/65084

13.9.3 Remote Probe Setup Using Installer

In section **Install a PRTG Remote Probe** 93, we accompany your remote probe installation using the Remote Probe Installer. Here you find further information about necessary settings for a successful core probe connection and debugging tips.

- Step 1: Prepare the Core Server 3206
- Step 2: Download and Install Remote Probe 3209
- Step 3: Approve New Probe and Start Monitoring 3209
- Debugging Probe Connection Problems 3210

For a semi-automatic installation of a Remote Probe directly from the device tree in the PRTG web interface, see section **Remote Probe Quick Setup** 3199.

Do you run PRTG in a cluster? Then mind this important note 3208.

Step 1: Prepare the Core Server

Because your remote probe needs to connect to your PRTG core server, your PRTG core server needs to accept incoming remote probe connections. So, please prepare your PRTG core server first.

Edit the relevant settings in **System Administration—Core & Probes** 2967. From the main menu in the PRTG web interface 138, select **Setup | System Administration | Core & Probes** to access the probes settings and go to the **Probe Connection Settings**.

Probe Connection Settings in System Administration

By default, a core server accepts connections from the **Local Probe only** (IP address 127.0.0.1). This setting is the most secure setting, but it does not allow any remote probe to connect to your PRTG core server.

To accept remote probes, choose one of the following settings:

- **All IPs available on this computer**: Any IP on your core server system accepts incoming probe connections.
- **Specify IPs**: Specify selected IP addresses that accept incoming connections.

Other settings are:

- In the **Access Keys** field, you can enter a new access key that can be used for a core probe connection. The access key can include arbitrary signs and have arbitrary length. During the remote probe install process PRTG will add an access key automatically, so usually you will not have to define a key here.
- In the **Allow IPs** field, you can enter the IP address of the computer you want to install a remote probe on. To make things easier, you can also enter the word **any:** this will set the core server to accept remote probes connecting from any IP address.
  If you use **any**, make sure you write the word in lower case only! Any other variations will not be valid!

- In the **Deny IPs** field, you can enter the IP address of the computers that you do not want to connect to the PRTG core server.
- In the **Deny GIDs** field, you can enter the global ID (GID) of a device in your network that you do not want to connect to the PRTG core server. Future probe connections from this device will be denied automatically.
  What is a global ID (GID)? It is the ID that PRTG Network Monitor attributes to every device that you include in your monitoring.

When you are done, click **Save** to save your settings. If you click **Cancel**, all changes to the core and probe settings will be discarded.

If you change this setting, PRTG needs to restart the core server to apply your changes. After clicking the **Save** button, a dialog box appears which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen. During the restart all the users of the PRTG web interface, of the **Enterprise Console** 3028, or of **PRTG Apps for Mobile Network Monitoring** 3082 will be disconnected and reconnected.

For further information about the core probe connection settings, see also the **System Administration—Core & Probes** 2967 section.

To edit the core probe connection settings you can also use the **PRTG Administration Tool** 3135 on your core server.

PRTG Cluster and Remote Probes Outside the LAN

If you use the **Clustering** 116 feature of PRTG and you want to run remote probes outside your local network, you have to make sure your cluster nodes and the addresses they use are reachable from the outside! Check your cluster node settings under **System Administration—Cluster** 2992 before installing a remote probe outside your local network. Enter addresses (DNS names or IPs) which are valid for both cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

If you already have a remote probe installed outside your LAN and the probe is disconnected because of this, please follow these steps:

1. Uninstall the current remote probe.
2. Update the cluster node settings 2992 with addresses that are reachable from outside your LAN.
3. Restart your PRTG core servers.
4. Install the remote probe again. It will then obtain the IP address or DNS name entries that it can reach.

See also section **Failover Cluster Configuration—Remote Probes in Cluster** 3215.

Step 2: Download and Install the Remote Probe

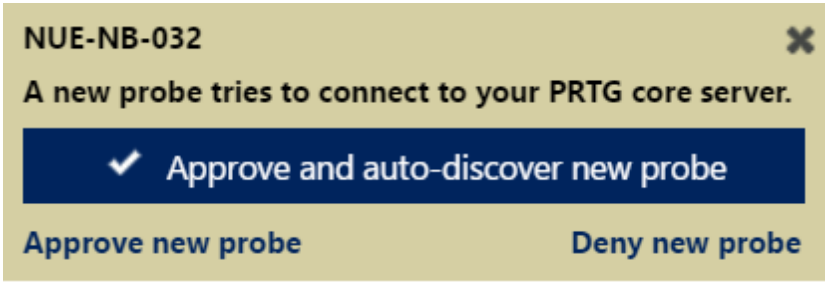
On the computer on which you want to install your remote probe, log in to the PRTG web interface 138, download the setup file, and install it. For more detailed instructions, please follow the steps described in **Install a PRTG Remote Probe** 93.

The PRTG core system already includes a local probe service. This is why you cannot additionally install a remote probe on that system.

The version numbers of core and probe services must match. By default, PRTG updates probes automatically when a new version is installed on the PRTG core server. To update your remote probe manually, open a web browser on your remote computer and download the remote probe installer as described in this manual section.

Step 3: Approve the New Probe and Start Monitoring

Remember to log in to the PRTG web interface to acknowledge your new remote probe!



Remote Probe Approval

If you successfully installed the remote probe from a PRTG on demand installation, you will see the following dialog box.

When you deny or remove a remote probe, PRTG will automatically add this device's global ID (GID) to the **Deny GIDs** list in **System Administration—Core & Probes** 2967. Future probe connections from this device will be denied automatically.

Denying the remote probe in the PRTG device tree does not uninstall the probe, but only denies access to the core server. The probe will continue to run on the target system until you uninstall it manually.

For unwanted probe connections, you can click **Deny new probe**.

When you deny or remove a remote probe, PRTG will automatically add this device's global ID (GID) to the **Deny GIDs** list in **System Administration—Core & Probes** 2967. Future probe connections from this device will be denied automatically.

Once approved, PRTG automatically creates a set of sensors for the probe to ensure you can detect bottle-necks on the probe system immediately. We recommend that you keep these sensors. You can now create groups, devices, and sensors for monitoring via the new probe.

Furthermore, when a new probe connects to the core server for the first time, PRTG creates a new ToDo ticket 201.

Debugging Probe Connection Problems

If you have trouble with your core probe connection, make sure that you meet the following requirements:

- The IP address of the computer on which you want to install a remote probe is not listed in the **Deny IPs** field.
- The default port 23560 for probe connections is not blocked by firewall rules on your core server's side.

If you need to set a different port (not recommended), see this Knowledge Base article: How can I customize PRTG's ports for core-probe-connections?

Furthermore, you can also take a look at the probe's log files. The probe process writes log files with a file name in the format **PRTG Probe Log (x).log**. Open the one with the most recent date.

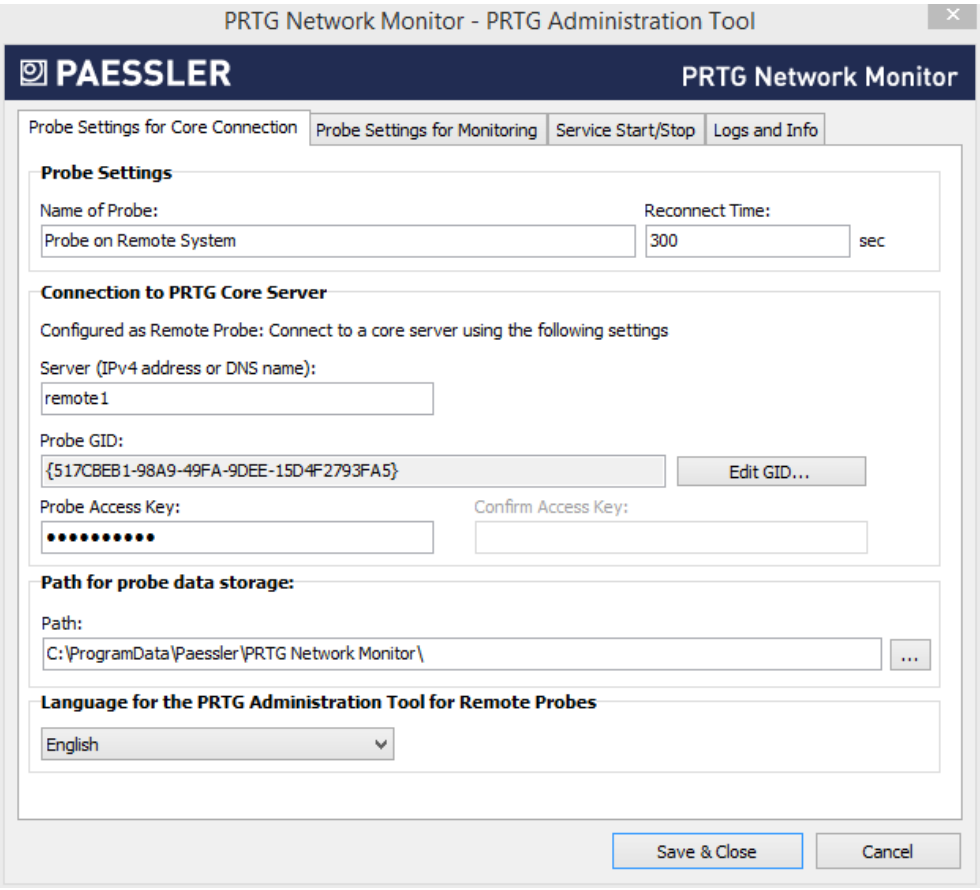
For a correct connection the probe log should look similar to this:

```
11.08.2012 16:15:15 PRTG Probe Server V12.3.2.5101
11.08.2012 16:15:15 Starting Probe on "WINXPVMWARE"
11.08.2012 16:15:15 Data Path: C:\documents and settings\All Users\a[...]
11.08.2012 16:15:15 Local IP: 0.0.0.0
11.08.2012 16:15:15 Core Server IP and Port: 10.0.2.167:23560
11.08.2012 16:15:15 Probe ID: -1
11.08.2012 16:17:01 Connected to 10.0.2.167:23560
11.08.2012 16:17:06 Login OK: Welcome to PRTG
```

If the connection fails, for example due to an incorrect **Access Key**, or due to incorrect **IP** settings (see **Step 2** 3209), you will see:

```
11.08.2012 16:31:02 Try to connect...
11.08.2012 16:31:02 Connected to 10.0.2.167:23560
11.08.2012 16:31:07 Login NOT OK: Access key not correct!
```

If you need to adjust any probe settings for the connection to the core server, use the **PRTG Administration Tool** 3157 on your probe system.



Remote Probe Settings in PRTG Administrator

In the **Connection to PRTG Core Server** tab, you can then edit the following settings:

- **Server**: Enter the IP address or DNS name of the core server the remote probe will connect to. If Network Address Translation (NAT) is used, this has to be the IP address that is externally visible, because the remote probe will connect from outside your network.
- **Probe Access Key** and **Confirm Access Key**: Enter the access key that the probe will send to the core server. This access key has to be defined on the PRTG core server. Make sure the key phrases match exactly.

Remember to always click **Save & Close** to confirm your settings and to (re)start the probe service.

For more detailed information about these settings, see section **PRTG Administration Tool** 3157.

More

Knowledge Base: How can I customize PRTG's ports for core-probe-connections?

- https://kb.paessler.com/en/topic/65084

13.10 Failover Cluster Configuration

PRTG offers single failover clustering in all licenses—even using the freeware edition. A single failover cluster consists of two servers (Current Master node and Failover node), each of them running one installation of PRTG. They are connected to each other and exchange configuration and monitoring data.

This feature is not available in PRTG on demand.

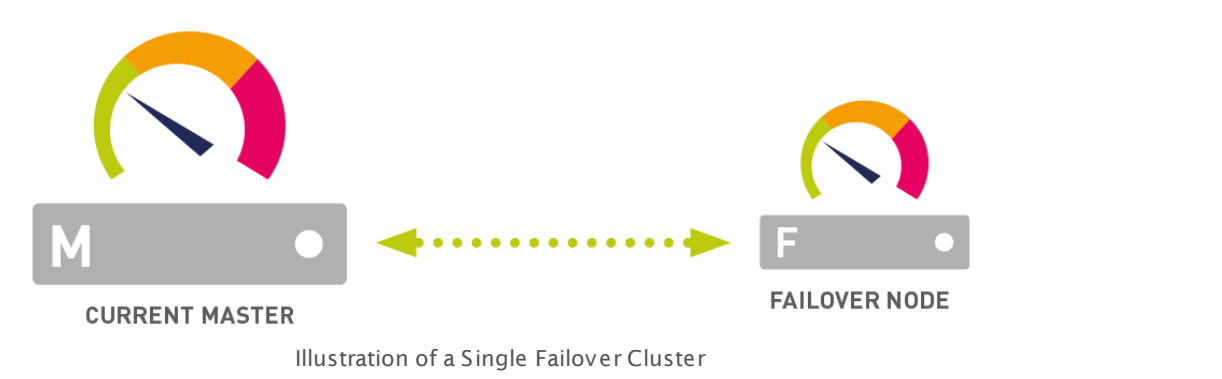


Illustration of a Single Failover Cluster

Click here to enlarge: http://media.paessler.com/prtg-screenshots/clustering-1_en.png

For setting up a cluster you need two or more servers. There is one PRTG core server installation 84 necessary on each of them—with different settings configured for each type of node. In return, you benefit from seamless high-available monitoring with automatic failover and multi-location monitoring.

In a cluster, you can run:

- **1 Master Node**
  On the master node, you set up your devices and configuration. Also notifications, reporting, and many other things are handled by the master node.

- **Up to 4 Failover Nodes**
  You can install one, two, three, or four additional nodes for fail-safe, gapless monitoring. For more than one failover node you need additional licenses 3224. Each of these nodes can monitor the devices in your network independently, collecting their own monitoring data. You can review the data in a summarized way, that enables you to compare monitoring data from different nodes.

During an outage of one node, you will see data gaps for the time of the outage on that node. However, data for that time span will still be available on all other cluster nodes.

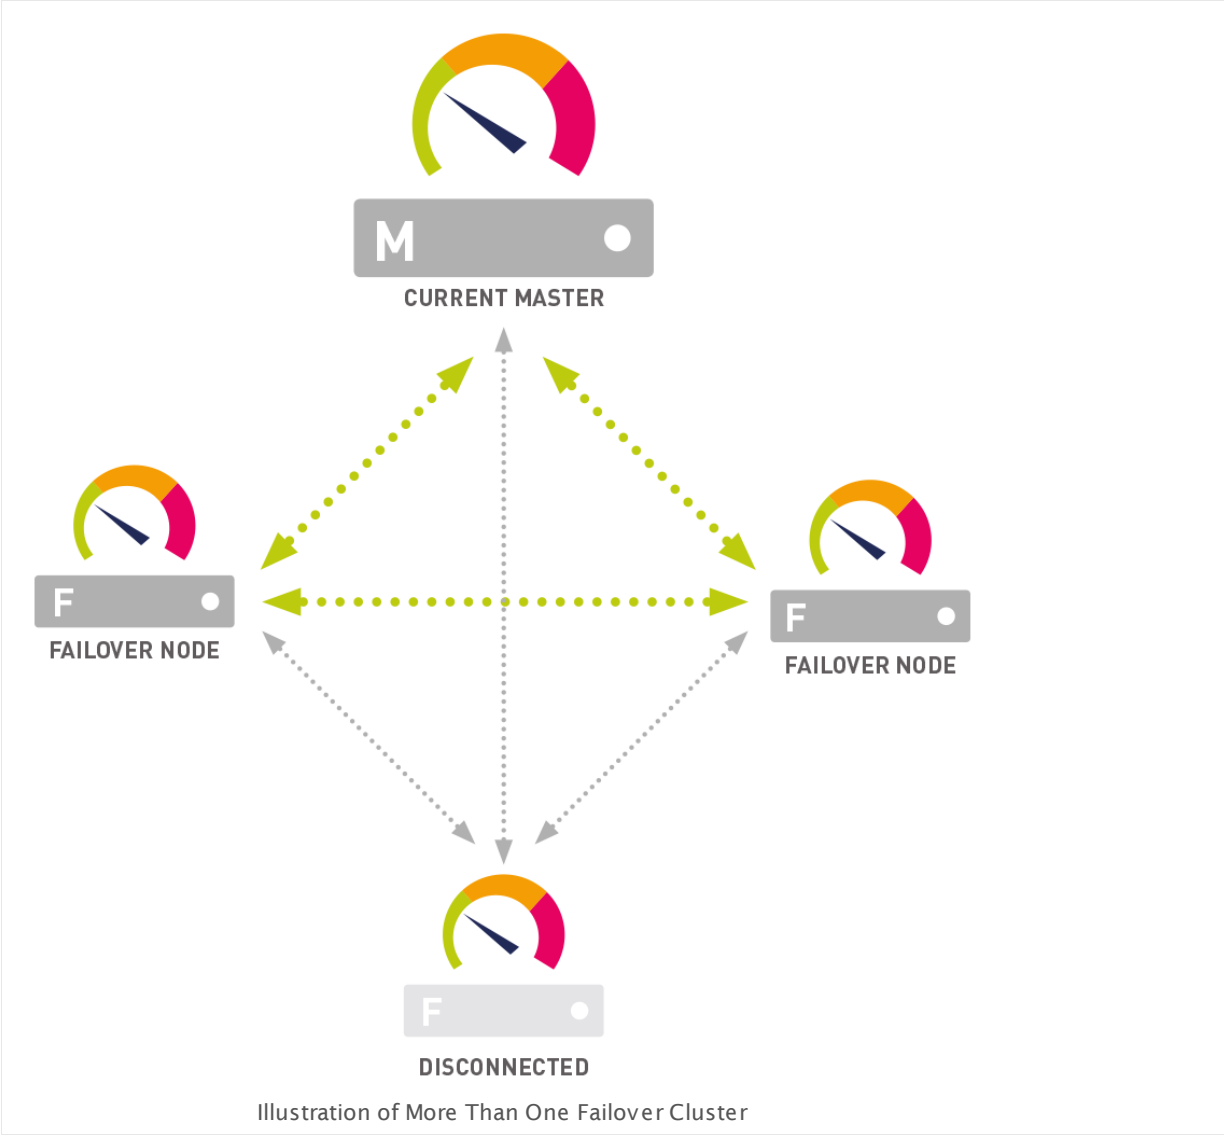

Illustration of More Than One Failover Cluster

Click here to enlarge: http://media.paessler.com/prtg-screenshots/clustering-2_en.png

Before Getting Started: Cluster Notes

Configuring a cluster with one failover node is the most common way to set up a seamless network monitoring with PRTG. You will need two servers running any Windows version (Windows 7 or later). Your servers can be real hardware (strongly recommended!) or virtual machines.

For details, see section Detailed System Requirements 25.

Please consider the following notes about PRTG clustering.

- Your servers must be up and running.

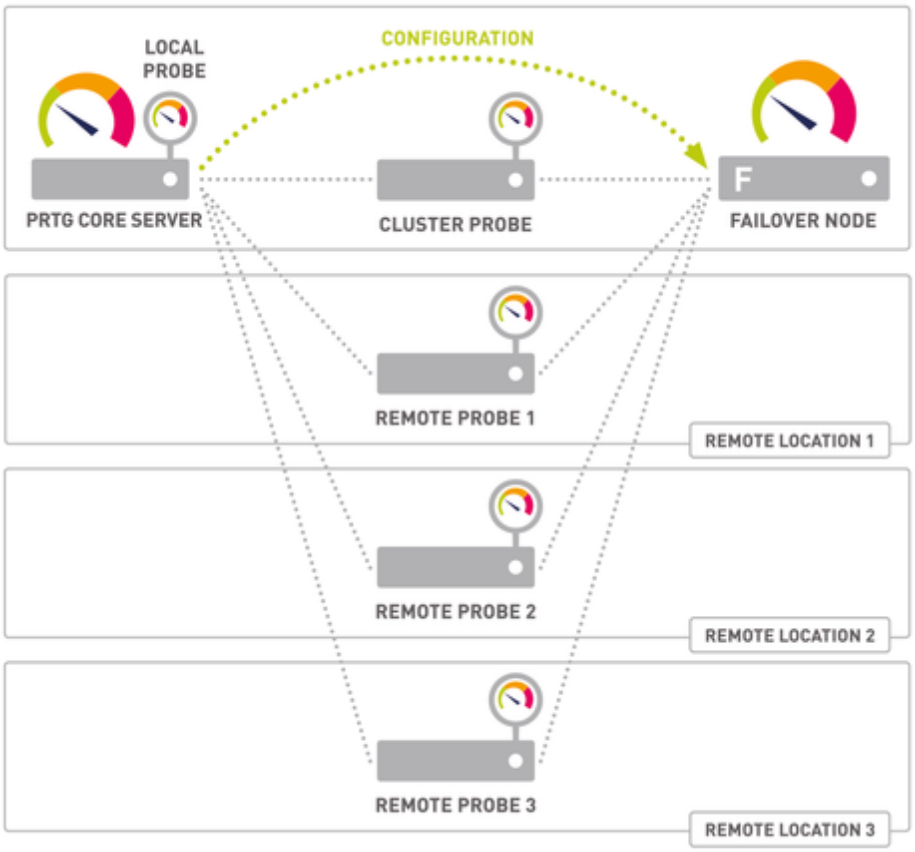
- Your servers must be similar in regard to the system performance and speed (like CPU, RAM memory).
- In a cluster setup, each of the cluster nodes will individually monitor the devices added to the **Cluster Probe**. This means that monitoring load will increase with every cluster node. Please make sure your devices and network can handle these additional requests. Often, a larger scanning interval for your entire monitoring is a good idea. For example, set up a scanning interval of 5 minutes in the **Root Group Settings** 294.
- We recommend that you install PRTG on dedicated real-hardware systems for best performance.
- Please bear in mind that a server running a cluster node may in rare cases be rebooted automatically without notice (for example, because of special software updates).
- Both servers must be visible for each other through the network.
- Communication between the two servers must be possible in both directions. Please make sure that no software or hardware firewall blocks communication. All communication between nodes in the cluster is directed through one specific TCP port. You will define it during cluster setup (by default, it is **TCP port 23570**).
- **Email notifications for failover:** The Failover Master will send notifications if the Primary Master is not connected to the cluster. To ensure that PRTG can deliver emails in this case, please configure the **Notification Delivery** 2961 settings so that PRTG can use them to deliver emails from your failover node as well. For example, use the option to set up a secondary Simple Mail Transfer Protocol (SMTP) email server. This fallback server must be available for the failover master so that it can send emails over it independently from the first email server.
- Make your servers safe! From every cluster node, there is full access to all stored credentials as well as other configuration data and the monitoring results of the cluster. Also, PRTG software updates can be deployed through every node. So, please make sure you take security precautions to avoid security attacks like hackers and Trojans. Secure every node server the same careful way as the master node server.
- Run the nodes in your cluster either on 32-bit or 64-bit Windows versions only. Avoid using both 32-bit and 64-bit versions in the same cluster, as this configuration is not supported and may result in an unstable system. Also, ZIP compression for the cluster communication will be disabled and you may encounter higher network traffic between your cluster nodes.
- If you run cluster nodes on Windows systems with different timezone settings and use **Schedules** 2938 to pause monitoring of defined sensors, schedules will apply at the local time of each node. Because of this, the overall status of a particular sensor will be shown as **Paused** every time the schedule matches a node's local system time. Please use the same timezone setting on each Windows with a cluster node to avoid this behavior.
- The password for the **PRTG System Administrator** login to PRTG is not automatically synchronized on cluster nodes. You need to manually change it on each node. On a failover node, open the **PRTG Administration Tool** 3146 and change the password on the **Administrator** tab. Click **Save&Close** to save your new password.
- Stay below 2,500 sensors per cluster for best performance in a single failover. Clusters with more than 5,000 sensors are not supported. For each additional failover node, divide the number of sensors by two.

In cluster mode, you cannot use sensors which wait for data to be received. Because of this, you can use the following sensor types only on a local or remote probe 112:

- HTTP Push Count 929
- HTTP Push Data 939
- HTTP Push Data Advanced 951
- IPFIX 1063 and IPFIX (Custom) 1075
- jFlow V5 1095 and jFlow V5 (Custom) 1107
- NetFlow V5 1207 and NetFlow V5 (Custom) 1219
- NetFlow V9 1230 and NetFlow V9 (Custom) 1242
- Packet Sniffer 1278 and Packet Sniffer (Custom) 1289
- sFlow 1457 and sFlow (Custom) 1469
- SNMP Trap Receiver 2143
- Syslog Receiver 2309

Remote Probes in Cluster

PRTG provides cluster support for remote probes. This means that all your probes can connect to all your cluster nodes, the primary master node as well as the failover node. Because of this you can still see monitoring data of remote probes and sensor warnings and errors even when your master node fails.



Remote Probes with Cluster Connectivity

Please consider the following notes about PRTG clustering with remote probes.

- You have to allow remote probe connections to your failover nodes. To do so, log in to each server in your cluster and open the **PRTG Administration Tool** 3139. On the **Core Server** tab, define to accept connections from remote probes on each cluster node.
- If you use remote probes outside your local network: You have to use IP addresses or DNS names for your cluster nodes that are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Open the **System Administration—Cluster** 2992 settings and adjust the entries for cluster nodes accordingly so that these addresses are reachable from the outside. New remote probes try to connect to these addresses but cannot reach cluster nodes which use private addresses.
- If you use Network Address Translation (NAT) with remote probes outside this NAT: You have to use IP addresses or DNS names for your cluster nodes that are reachable from the outside. If your cluster nodes are inside the NAT and the cluster configuration only contains internal addresses, your remote probes from outside the NAT will not be able to connect. The PRTG core server must be reachable under the same address for both other cluster nodes and remote probes.
- A remote probe only connects to the PRTG core server with the defined IP address when starting. This PRTG server must be the **Primary Master**!

- Initially, existing remote probes are not visible on failover nodes. You need to set their **Cluster Connectivity** first in the **Administrative Probe Settings** 330 to be visible and working with all cluster nodes. Choose option **Probe sends data to all cluster nodes** for each remote probe that you want to connect to all cluster nodes.
- Newly connected remote probes are visible and working with all cluster nodes immediately after you have acknowledged the probe connection. The connectivity setting **Probe sends data to all cluster nodes** is default for new probes.
- As soon as a probe is activated for all cluster nodes, it connects automatically to the correct IP addresses and ports of all cluster nodes.
- Once a remote probe has connection data from the Primary Master, it can connect to all remaining cluster nodes also when the Primary Master fails.
- Changes to connection settings of cluster nodes are automatically sent to your remote probes.
- If a PRTG server (which is a cluster node) in your cluster is currently not running, your probes will deliver monitoring data 3197 after the restart of this server. This happens individually for each PRTG server in your cluster.
- If you switch on cluster connectivity for a probe, it will not deliver monitoring data from the past when cluster connectivity was off. For sensors using difference values, the difference between the current value and the last value is shown with the first new measurement (if the respective sensor previously sent values to the PRTG server).
- Except for this special case, all PRTG servers show the same values of sensors on devices you add to the Cluster Probe.
- The responsible PRTG server for the configuration and management of a remote probe is always the master that is currently active. This means that all tasks of the PRTG core server are only executed by the current master. If you use a split cluster with several master nodes, only the master that appears first in the cluster configuration is responsible.

You can use remote probes in a cluster as described above, which is showing monitoring data of all your probes on all nodes in your cluster. However, you cannot cluster a remote probe itself. To ensure gapless monitoring for a specific remote probe, install a second remote probe on a machine in your network next to the existing probe, and create all devices and sensors of the original probe on it. For example, you can clone 2812 the devices from the original probe. The second probe would be a copy of the first probe then and you can still monitor the desired devices if the original probe fails.

Probes that send data to all cluster nodes result in increased bandwidth usage. Choose the option **Probe sends data only to primary master node** in the **Administrative Probe Settings** 330 for one or more remote probes to lower bandwidth usage if necessary.

Please explicitly check on each cluster node if a remote probe is connected. PRTG does not notify you if a remote probe is disconnected from a node in the cluster. For example, log in to the PRTG web interface on a cluster node and check in the device tree if your remote probes are connected.

13.10.1 Failover Cluster Step by Step

This section will guide you through a step-by-step process to set up a failover cluster. Please follow these instructions carefully to successfully integrate two or more PRTG installations into one failover cluster.

Before getting started, please make sure you consider the information in section **Failover Cluster Configuration** 3212.

This feature is not available in PRTG on demand.

Step 1: Install Core Servers

We will start with setting up a single failover cluster, consisting of two PRTG core server installations, each running on an individual server. Please use your license key twice to install the PRTG core server on two different computers.

If you already run an installation of PRTG, this will be your future Master Node. In this case, please install a second core server on another computer only. Make sure you use the same license key for both installations.

Before you start to set up a cluster, please make sure you run exactly the same PRTG version (build number) on all (future) nodes (install updates for existing installations, if necessary).

Once the cluster is established, any updates you install on one node will be deployed to all other cluster nodes automatically.

For details about the installation process, please see **Install a PRTG Core Server** 84.

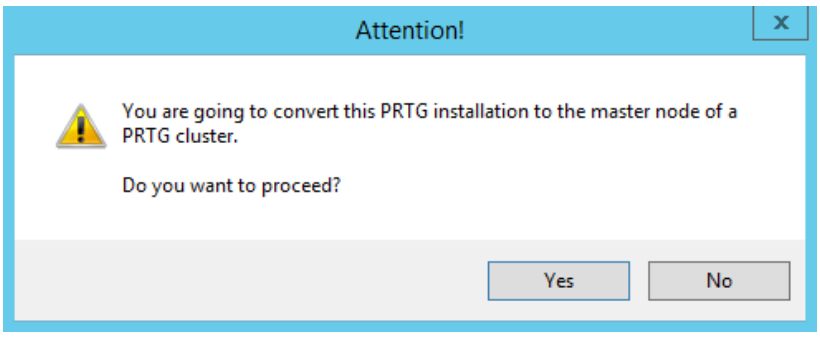
Step 2: Configure Master Node

Decide which of your PRTG core server installations will be your future Master Node. If you already run an installation of PRTG in your network for some time, this should be your master, so your existing monitoring configuration is being kept.

On the Master Node server, from the Windows start menu, open the **PRTG Administration Tool** 3141. On the Cluster tab, click on the following button:

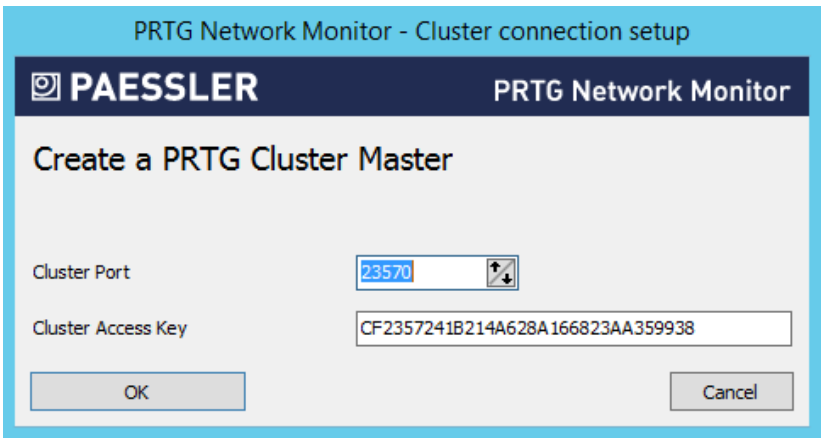
Create a PRTG Cluster...

- Click this button to start creating a cluster. The current PRTG core server will then be the **Master Node** of your cluster.
- Click **Yes** to confirm the conversion of this installation into a cluster master node.



Converting an Installation into a Cluster Master Node

- A new dialog box will appear.



PRTG Administrator: Creating a Cluster Master

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- We recommend that you use the default value.
- Save the **Cluster Access Key** so you have it at hand when configuring your **Failover Node (s)**.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

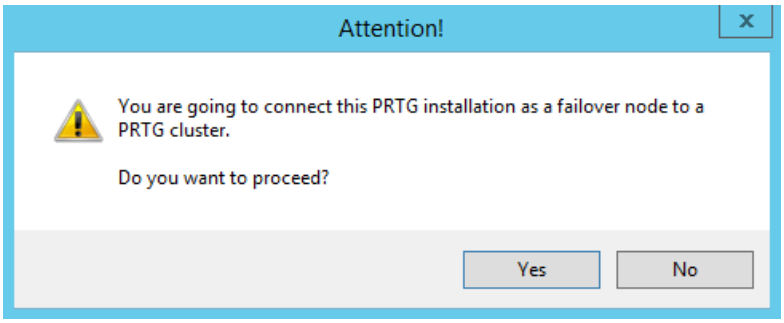
Step 3: Configure Failover Node

On the server that will be your Failover Node, open the PRTG Administration Tool 3141. On the Cluster tab, click the following button:

Join a PRTG Cluster...

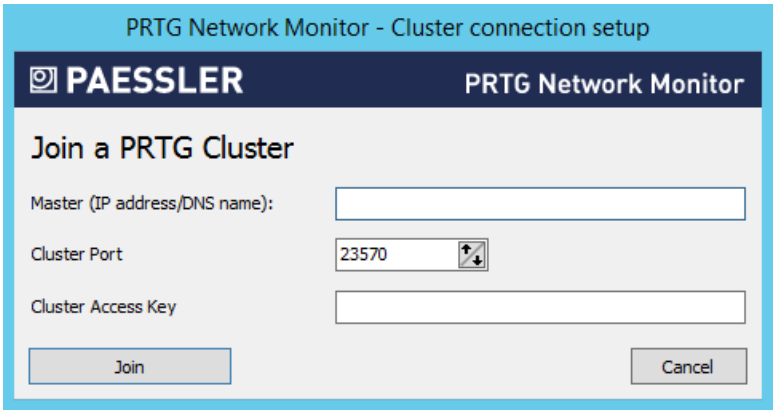
- Click this button to add this installation to an existing cluster that already has a **Master Node**. The current PRTG core server will then be a **Failover Node** in the cluster.

- This button is also available if you are currently running your PRTG installation in **Cluster Mode: Master Node**. This option will then change your master node to a failover node!
- Click **Yes** to confirm the conversion of this installation into a failover node.



Converting an Installation into a Cluster Failover Node

- A dialog box will appear.



PRTG Server Administrator

- Enter a **Master IP address/DNS name** for your cluster. It must be reachable from the machine running the failover node.
- Enter the other settings as defined in the settings of your **Master Node.** Please make sure you use the same settings on all nodes in your cluster.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

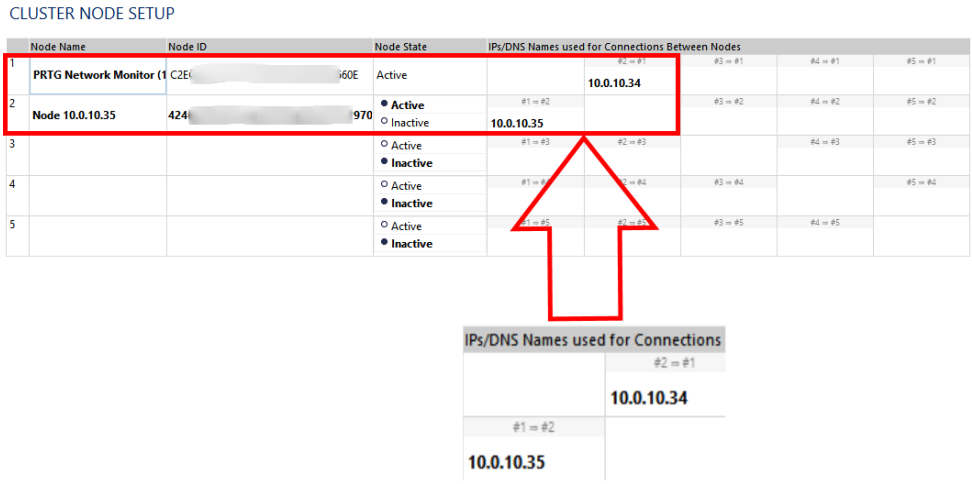
Step 4: Confirm Failover Node

Now you need to confirm the new failover node by setting it to **Active** in the master node's settings.

In a browser window, log in to the PRTG web interface 138 of the Master Node server.

In the **System Administration—Cluster** 2992 settings, you will see your "Master Node" server in the first line of the cluster list and your "Failover Node" server below.

If you use remote probes 3196 outside your local network, for each core server in the cluster use a DNS name or IP address that the probes can reach from the outside. Enter the entries in the **Cluster Node Setup** 2992 table accordingly (see below). The addresses must be valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot reach private IP addresses or DNS names!

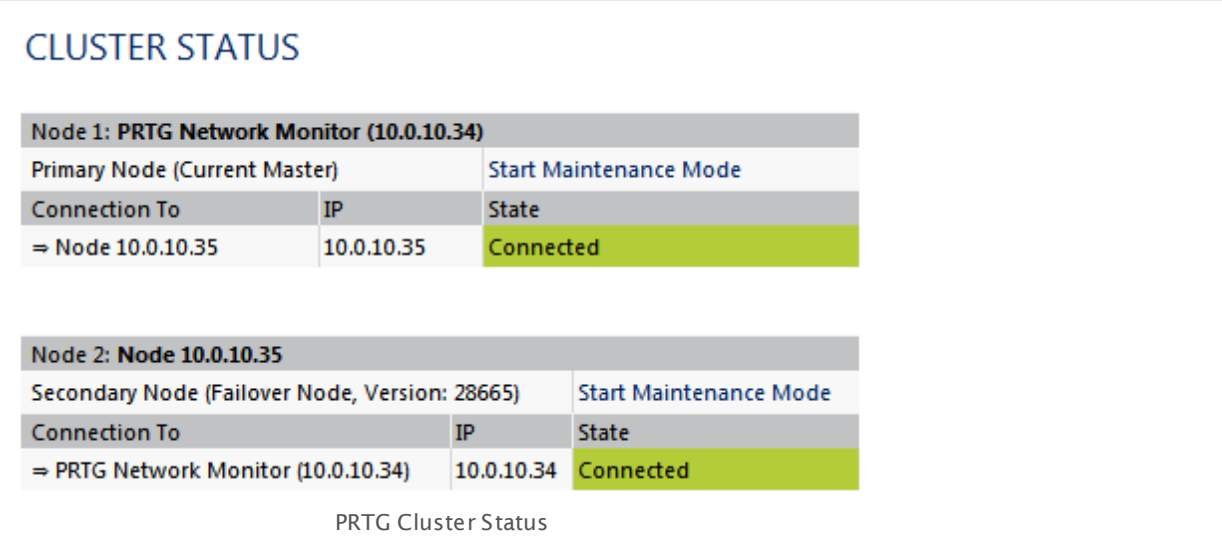


System Administration: Cluster Node Setup

For the "Failover Node", set the radio button for **Node State** to **Active** and **Save** the changes. The nodes will now connect and exchange configuration data. This may take a few minutes.

Step 5: Check Cluster Connection

In two browser windows, log in to the PRTG web interfaces of both of your PRTG installations. Open the cluster status page in both windows by clicking on the narrow cluster information bars at the top of each window. You should see a cluster status with your two nodes in a **Connected** state after a few minutes.



CLUSTER STATUS

Node 1: **PRTG Network Monitor (10.0.10.34)**		
Primary Node (Current Master)		Start Maintenance Mode
Connection To	IP	State
⇒ Node 10.0.10.35	10.0.10.35	Connected

Node 2: **Node 10.0.10.35**		
Secondary Node (Failover Node, Version: 28665)		Start Maintenance Mode
Connection To	IP	State
⇒ PRTG Network Monitor (10.0.10.34)	10.0.10.34	Connected

PRTG Cluster Status

Step 6: Trouble Shooting

Having any problems? If your nodes cannot connect, please see

- the cluster log entries on the **PRTG Status—Cluster Status** 3010 page of the web interface
- the core server log file, a text file in the logs directory of your PRTG data folder (see section **Data Storage** 3226).

In the latest entries of these logs, you can see messages about any errors that might have occurred. These will give you hints on where to find a solution.

If you encounter connection problems between the two cluster nodes, please make sure no software or hardware firewall is blocking communication on the cluster port defined during cluster setup. Communication between the nodes must be possible in both directions in order for the cluster to work properly.

Step 7: Move Sensors to the Cluster Probe Now

That's it. You have successfully set up your failover cluster. All devices that you create or move under the **Cluster Probe** are monitored by both servers.

To monitor your existing configuration via all cluster nodes, on your master node, please move your groups, devices, and sensors from the local probe to the cluster probe! Objects, including their settings, will then be transferred to all cluster nodes automatically.

Step 8: Move Custom Content to Failover Nodes

On startup of the cluster master node, maps 2885 and custom lookups 3183 are automatically transmitted to the failover nodes. While changes to maps are automatically synchronized, you have to manually (re-)load lookups 3192 on all nodes. Other custom content has to be copied manually from the according folders 3226 on the master node to the same folders on the failover nodes:

- Device templates 2818: **\devicetemplates** subfolder of PRTG
- Custom sensors 2778: **\Custom Sensors** subfolder of PRTG
- MIB files 3088: **\MIB** subfolder of PRTG
- SNMP libraries 1913: **\snmplibs** subfolder of PRTG
- Notifications 2916: **\Notfications** subfolder of PRTG
- The **\webroot** subfolder of PRTG if you customized the PRTG web interface, for example

Add More Failover Nodes

If you want to add an additional failover node to your cluster, you will need an additional license key for two and three failover nodes, and two additional license keys to run four failover nodes.

In a cluster, only core servers running on the same size of license 21 can be combined. For example, you can use several "PRTG 5000" licenses or several "PRTG 1000" licenses in one cluster. To add another failover node to your cluster, please set up a new PRTG core server installation on a new server, using an additional license key. Then proceed with **Step 3** 3220 and following. Use a second license key to set up both your second and third failover node, and use a third license key to set up your fourth failover node. Each failover cluster is technically limited to five cluster nodes: as a maximum, you can run one master node and four failover nodes in one cluster.

Stay below 2,500 sensors per cluster for best performance in a single failover. Clusters with more than 5,000 sensors are not supported. For each additional failover node, divide the number of sensors by two.

13.11 Data Storage

PRTG stores the monitoring configuration, monitoring data, logs, tickets, and reports, as well as support and debug data into different folders on the core server or the system running a **Remote Probe** 3195. Additionally, there is data from PRTG in the program directory (for example, scripts for your custom sensors 2778) and in the Windows registry.

You can find data in different locations. For detailed information, see this Knowledge Base article: How and where does PRTG store its data?

You cannot access these directories on the PRTG on demand core server system.

PRTG Program Directory

32-bit systems:

```
%programfiles%\PRTG Network Monitor
```

64-bit systems:

```
%programfiles(x86)%\PRTG Network Monitor
```

These are the default paths. If you specified another installation directory, you will find your data there.

PRTG Data Folder

On Windows Vista (not officially supported), Windows 7, Windows 2008, Windows 8, and Windows 2012:

```
%programdata%\Paessler\PRTG Network Monitor
```

On Windows XP and Windows Server 2003 (both are not officially supported):

```
%ALLUSERSPROFILE%\Application data\Paessler\PRTG Network Monitor
```

These are the default paths, depending on your Windows version. If you specified a custom path for data storage, please look it up in the **PRTG Administration Tool** 3139: Open this application and switch to the **Core Server** tab. You will find the path there.

Windows Registry

System settings on 32-bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor
```

System settings on 64-bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor
```

Enterprise Console settings:

```
HKEY_CURRENT_USER\Software\Paessler\PRTG Network Monitor\WinGUI
```

HTTP Full Web Page Sensor: Cached Files

If you use the HTTP Full Web Page Sensor, files might be cached in this directory;

```
C:\Windows\System32\config\systemprofile\AppData\Local\Microsoft\Windows\Temporary Internet Files\Content.
```

13.12 Using Your Own SSL Certificate with PRTG's Web Server

This section gives you a brief overview on how to use your own trusted SSL certificate files with the PRTG web server.

This only applies to PRTG on premises instances, not to PRTG on demand.

What is SSL?

PRTG supports Secure Sockets Layer (SSL) to encrypt all data entered and shown in the **Web Interface** 136, in the **Enterprise Console** 3028, or in the **Smartphone Apps** 3082. This ensures that no sensitive information can be intercepted when sending data between the PRTG core server and your client software.

By default, PRTG is already delivered with an SSL certificate so you can use secure connections to your PRTG core server. However, these certificate files are not signed by a valid authority, which is why browsers show an **SSL Certificate Warning** 142 when you try to access the web interface. Despite this warning your connection is still encrypted successfully.

To remove the browser warning, you can obtain a certificate that is valid for your own domain name and signed by a valid authority. You can request your own trusted certificate from an issuer like GoDaddy, DigiCert, InstantSSL, or StartSSL, for example. The certificate must be provided in a suitable format and you have to import it correctly for your PRTG server.

Importing Trusted SSL Certificates for PRTG

There are many different issuers for certificates, and there are different formats certificates can be provided in. PRTG needs three different files, named correctly, containing data in the expected encoding and format. This can the manual import of an issued certificate slightly complicated, because there are various certificate files that you must retrieve from a certificate authority (CA). So, to ease the installation of a trusted certificate, we provide the freeware tool **PRTG Certificate Importer**.

The PRTG Certificate Importer combines and converts all files that a CA bundle contains automatically for the use with PRTG and stores the certificate files into the correct path on your PRTG server. In the best case, you just provide the path to your received CA bundle and let the tool do the rest. We strongly recommend that you use the PRTG Certificate Importer if you want to install a trusted certificate for PRTG!

For more information about this tool and a download link, see the Paessler website: PRTG Certificate Importer

Manual Certificate Import

Although we recommend that you use the PRTG Certificate Importer because it is much more comfortable, you still can import your trusted certificate manually. If you do so, please note that PRTG requires three different certificate files in a PEM encoded format and an unencrypted private key:

- **prtg.crt**: This is the certificate for your PRTG server. It has to be stored in PEM encoded format.

- **prtg.key**: This is the private key matching your server certificate. It has to be stored in PEM encoded format and may not be encrypted! Please make sure that you provide this file in decrypted format! The best way to check this is to open the file in a text editor. If you find a line containing the word "ENCRYPTED", the file still needs to be decrypted before you can use it with PRTG. Please decrypt using an SSL tool (for example, OpenSSL) and your key password.
- **root.pem**: This is the public root certificate of your certificate's issuer. It has to be stored in PEM encoded format and must contain all necessary root certificates of your issuer in one file. If there is more than one PEM encoded root certificate, please use a text editor to copy all of them into a single file (the order does not matter).

PEM encoded files must not contain Unix line breaks! Only Windows line breaks are supported.

Once ready, copy these three files to the **/cert** sub folder of your PRTG program directory (please backup existing files) and restart your PRTG core server service (see **PRTG Administration Tool** 3151).

PRTG services will not be able to start if the files are not provided in exactly the expected format!

For detailed instructions and examples, installation descriptions for various certificates (including Wildcard certificates), as well as links to certificate tools and converters, please see the **More** 3229 section below.

14.1 Glossary

This section explains special words used in the context of PRTG Network Monitor.
Here, only explanations are given. For information on where to find detailed instructions for a specific key word, please see the **Index** section.

Channel

The monitoring data of a sensor is shown in sensor channels. For example, for sensors that measure network traffic, there is one channel each for traffic in and traffic out. You can set various triggers for each channel, so you can define sensor status changes or notifications based on the monitoring data received.

Cluster

You can configure PRTG as a failover cluster for fail-safe monitoring. In a cluster, one or more core servers work together in one configuration. Every node can monitor every device in a network for gapless monitoring, so you can additionally compare monitoring results measured from different perspectives.

Cluster Node

Sometimes used as synonym for Node.

Cluster Probe

When running PRTG in cluster mode, a cluster probe is automatically created. All objects created on the cluster probe or below in the device tree are monitored by all nodes in the cluster. Create or move objects there to monitor them fail-safely. If one node fails, the other nodes will continue to monitor them. You can add groups and devices to the probe. On a PRTG installation, the cluster probe runs as part of this installation's local probe. Your remote probes can send monitoring data to your cluster nodes so you can view the data of each probe on each cluster node.

Core Server

The central unit of PRTG. It receives monitoring data from the probe(s) and handles reporting and notifications, provides the web server for the user interfaces, and many other things. In a cluster, one core server is installed on every node.

Dashboard

In the **Home** menu of the web interface are several pre-configured dashboards available that show a quick overview of the overall status of your monitoring configuration. You can create custom dashboards using the Maps function.

Device

A device in PRTG represents a "real" physical device in the network. For an easily understandable tree structure, you usually create one PRTG device for each physical device you want to monitor (exceptions apply to some sensors that you can only create on the local probe 3235 device, and for sensor types that are not bound to a certain device, such as HTTP sensors, which are also usually created on the local probe). You can add one or more sensors 3236 on every device.

Device Tree

The configuration of PRTG is represented in a hierarchical tree structure, the device tree, containing all objects 3235. While building the tree, you can relate to your network's topology to make your monitoring setup easy to understand.

Failover Master (Node)

If the primary master 3235 node fails, a failover node 3234 is promoted to current failover master and takes over the master role until the primary master node re-joins the cluster 3233.

Failover Node

In a cluster 3233 a failover node monitors all sensors 3236 on the cluster probe 3233, providing monitoring data for the core server 3233. Additionally, it serves as a backup in case the master node 3235 fails.

Geo Maps

Geo Maps show the different locations of your devices on a map, depending on the location data that you provide in the settings of groups or devices. The tiles on the maps that represent your devices also show the overall status of a location. This is useful for monitoring distributed networks.

Group

A group is an organizational unit in your PRTG tree structure that helps to arrange your devices. You can add devices or additional sub-groups to existing groups. This way you can model your physical network's topology within the PRTG configuration.

Library

Libraries are a way to show parts of your device tree 3234 in a different layout or with different filters enabled. There is an editor available that allows you to create libraries directly in your browser.

Local Probe

The local probe is installed together with the core server. All objects created on the local probe, or below it in the device tree, are monitored by the local core system. You can add groups and devices to the probe.

Map

Maps (sometimes referred to as "dashboard") are a way to present monitoring the way you want to arrange it. There is an editor available that allows creating maps directly in your browser.

Master Node

In a cluster, the master node controls the settings and cluster management. It also takes over notifications. All changes to the monitoring configuration are made on the master node.

Node

In a cluster there is one master node and one or more failover nodes. On each node, one PRTG core server installation is running independently. All nodes are connected to each other, exchanging configuration and monitoring data.

Object

All different items in the device tree are generally referred to as objects or monitoring objects. An object can be a probe, a group, a device, or a sensor.

Primary Master (Node)

The primary master node in a cluster is the node that is master by configuration. Only if it fails, one of the failover nodes becomes failover master and takes over the master role until the primary master node re-joins the cluster.

Probe

On a probe, the actual monitoring takes place. A probe can run as local probe on the local system where the core server is installed. There are also cluster probes and remote probes.

Remote Probe

A remote probe is a small piece of software installed on a computer in the local or remote network. It scans the network from there and sends monitoring results to the core server 3233. Once the connection is established, the remote probe is shown in the PRTG tree structure. All objects 3235 created on the remote probe, or below it in the device tree 3234, are monitored by the remote system running the remote probe. You can add groups 3234 and devices 3234 to the probe. In a cluster 3233, remote probes can connect to all cluster nodes so you can view monitoring data of a probe on all nodes.

Sensor

A sensor monitors one aspect of a device 3234. For example, monitoring if a device responds to a Ping request is done by one sensor. Monitoring the traffic of one Ethernet port of a router device is done by another sensor. For monitoring the CPU load of the local system yet another sensor is set up, and so on. The data of sensors is shown in their respective channels 3233.

Sensor Tree

Sometimes used as synonym for device tree 3234.

Tickets

Tickets 200 are created by the system or a PRTG user and contain important messages or action steps for the administrator or another specific user to take. Every ticket should be viewed to take appropriate actions. You can access the list of tickets from the main menu.

xFlow

Paessler designates all kinds of flow protocols as xFlow. Currently, PRTG supports NetFlow V5 and V9, IPFIX, sFlow V5, and jFlow V5.

14.2 List of Abbreviations

Please see below for a list of abbreviations used in this documentation.

ADO: ActiveX Data Objects (ADO)

ADSL: Asymmetric Digital Subscriber Line (ADSL)

AJAX: Asynchronous Java Script and XML (AJAX)

API: Application Programming Interface (API)

CBQoS: Class Based Quality of Service (CBQoS)

cDOT: clustered Data ONTAP (cDOT)

CGI: Common Gateway Interface (CGI)

CIFS; Common Internet File System (CIFS)

CLI: command-line interface (CLI)

CoS: Class of Service (CoS)

CSV: Comma Seperated Values (CSV)

DAG: Database Availability Group (DAG)

DHCP: Dynamic Host Configuration Protocol (DHCP)

DMZ: Demilitarized Zone (DMZ)

DSCP: Differentiated Services Code Point (DSCP)

DNS: Domain Name Service (DNS)

DSCP: Differentiated Services Code Point (DSCP)

FAT: File Allocation Table (FAT)

FTP: File Transfer Protocol (FTP)

FTPS: FTP over SSL (FTPS)

FQDN: Fully Qualified Domain Name (FQDN)

GID: global ID (GID)

GUI: Graphical User Interface (GUI)

GUID: Globally Unique Identifier (GUID)

HTTP: Hypertext Transfer Protocol (HTTP)

HTTPS: Hypertext Transfer Protocol Secure (HTTPS)

ICMP: Internet Control Message Protocol (ICMP)

ICPIF: Impairment Calculated Planning Impairment Factor (ICPIF)

iDRAC: Integrated Dell Remote Access Controller (iDRAC)

IIS: Microsoft Internet Information Services (IIS)

iLO: HP Integrated Lights-Out (iLO)

IMAP: Internet Message Access Protocol (IMAP)

IPFIX: IPFIX (Internet Protocol Flow Information Export)

IPMI: Intelligent Platform Management Interface (IPMI)

IPsec: Internet Protocol Security (IPsec)

iSCSI: internet Small Computer System Interface (iSCSI)

JSON: JavaScript Object Notation (JSON)

LAN: Local Area Network (LAN)

LDAP: Lightweight Directory Access Protocol (LDAP)

MIB: Management Information Base (MIB)

MoID: Managed Object ID (MoID)

MOS: Mean Opinion Score (MOS)

MSP: Managed Service Provider (MSP)

NAS: Network Attached Storage (NAS)

NAT: Network Address Translation (NAT)

NFS: Network File System (NFS)

NSA: Network Security Appliance (NSA)

NTFS: New Technology File System (NFTS)

NTLM: NT LAN Manager (NTLM)

OID: Object Identifier (OID)

OMSA: OpenManage Server Administrator (OMSA)

PDF: Portable Document Format (PDF)

PDV: Packet Delay Variation (PDV)

POP3: Post Office Protocol version 3 (POP3)

QoS: Quality of Service (QoS)

RADIUS: Remote Authentication Dial-In User Service (RADIUS)

REST: Representational State Transfer (REST)

RMON: Remote Monitoring (RMON)

RPC: Remote Procedure Call (RPC)

RTT: Round Trip Time (RTT)

SaaS: Software as a Service (SaaS)

SAN: Storage Area Network (SAN)

SASL: Simple Authentication and Security Layer (SASL)

SCVMM: System Center Virtual Machine Manager (SCVMM)

SIP: Session Initiation Protocol (SIP)

SLA: Service Level Agreement (SLA)

S.M.A.R.T.: Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.)

SMB: Server Message Block (SMB)

SMTP: Simple Mail Transfer Protocol (SMTP)

SNI: Server Name Identification (SNI)

SNMP: Simple Network Management Protocol (SNMP)

SNTP: Simple Network Time Protocol (SNTP)

SOAP: Simple Object Access Protocol (SOAP)

SPAN: Switched Port Analyzer (SPAN)

SQL: Structured Query Language (SQL)

SRP: Secure Remote Password (SRP)

SSH: Secure Shell (SSH)

SSL: Secure Sockets Layer (SSL)

SSO: Single Sign-On (SSO)

TCP: Transport Control Protocol (TCP)

TFTP: Trivial File Transfer Protocol (TFTP)

TLS: Transport Layer Security (TLS)

UAC: User Account Control (UAC)

UCS: Unified Computing System (UCS)

UDP: User Datagram Protocol (UDP)

UNC: Uniform Naming Convention (UNC)

UPnP: Universal Plug and Play (UPnP)

UTC: UTC (Coordinated Universal Time)

UUID: Universally Unique Identifier (UUID)

VoIP: Voice over IP (VoIP)

VPN: Virtual Private Network (VPN)

WAN: Wide Area Network (WAN)

WBEM: Web-Based Enterprise Management (WBEM)

WMI: Windows Management Instrumentation (WMI)

WQL: Windows Management Instrumentation Query Language (WQL)

WSUS: Windows Server Update Services (WSUS)

XML: Extensible Markup Language (XML)

14.3 List of Icons

Please see below for a list of icons used in this documentation.

There is more detailed information on how this feature works exactly.

This feature is in beta status and may not function properly in all situations.

There is more information on this topic in another section in the PRTG manual.

There is more information on this topic in the Paessler Knowledge Base.

Notes that contain information about potential errors and that offer tips on how to keep them from occurring.

Notes that contain extremely critical information. Pay close attention to these notes, otherwise they could have serious consequences.

Notes that contain critical information. Pay close attention to these notes, otherwise PRTG might not function properly.

Notes that contain additional information.

Step-by-step instructions.

Examples on how to use a feature.

Calls to action. These contain tips, requirements, or instructions on what you need to enter in certain fields, or inform you that certain programs or apps need to be installed.

This information is relevant for PRTG on demand.

This information is relevant for PRTG on premises.

14.4 Support and Troubleshooting

Need help with PRTG? There are several ways to get support and troubleshoot.

Video Tutorials

A video says more than a thousand words—watch tutorials for PRTG from Paessler and other PRTG users.

- https://www.paessler.com/support/videos

Paessler Knowledge Base

In the Knowledge Base, you can search in hundreds of articles about PRTG. You can post your own questions and answers, too!

- https://kb.paessler.com

Open a Support Ticket

Users that have purchased a license can open support tickets, which will usually be answered by Paessler's staff in less than 24 hours on business days. Please use the support form 3022 that is available in PRTG to contact our support team. This is the best way to get detailed help quickly. If you cannot use this form, contact us via our webpage.

- https://shop.paessler.com/en/openticket

14.5 Differences between PRTG on Premises and PRTG on Demand

Please see below for the differences between the settings and features that PRTG on premises and PRTG on demand have to offer.

Licensing, Payment, Infrastructure

TOPIC	PRTG ON PREMISES	PRTG ON DEMAND BETA
Trial Period	30 days	10 days
Freeware	freeware (100 sensors) available	no freeware, smallest edition is PRTG-500
Payment	one-time license fee plus yearly maintenance	monthly fee
PRTG Edition Size Flexibility	upgrade only	upgrade or downgrade
Max. Installation Size	unrestricted	5,000 sensors
PRTG Update Management	done by user	done by Paessler
Enterprise Console	full support	not supported: connections are not possible

Features

FEATURE	PRTG ON PREMISES	PRTG ON DEMAND BETA
Cluster	☺	⊘
Customizations (CSS, HTML, lookups, maps, device icons)	☺	⊘

FEATURE	PRTG ON PREMISES	PRTG ON DEMAND BETA
Freeware (100 sensors)	☺	⊘
RDP Access to Core Server	☺	⊘
Historic Data Purging (manually defined)	☺	⊘
Active Directory Integration	☺	⊘
License settings via PRTG web interface	☺	⊘
Recommended Sensors on Local Probe	☺	⊘
Auto-Discovery on Local Probe	☺	⊘
Mini Probes	☺	⊘
Device Tools on Local Probe	☺	⊘
Proxy Server settings	☺	⊘
System Information on Local Probe	☺	⊘
PRTG Administration Tool on PRTG Core Server	☺	⊘
MIB import and and usage as oidlib with SNMP Library sensor	☺	⊘
MIB import for SNMP Trap Receiver sensor	☺	⊘
Notification types: ▪ SMS/Pager Message ▪ Add Entry to Event Log ▪ Syslog Message	☺	⊘

FEATURE	PRTG ON PREMISES	PRTG ON DEMAND BETA
▪ SNMP Trap Message ▪ Execute Program		
Re-login request on setup pages after 15 minutes	☺	⊘

Sensors on Local Probe of PRTG on Demand

If you use PRTG on demand, you can add the following sensors only to remote probes.

SENSOR ON LOCAL PROBE	PRTG ON DEMAND BETA
Active Directory Replication Errors Sensor	⊘
ADO SQL v2 Sensor	⊘
Dell PowerVault MDi Physical Disk Sensor	⊘
Dell PowerVault MDi Logical Disk Sensor	⊘
Enterprise Virtual Array Sensor	⊘
Event Log (Windows API) Sensor	⊘
Exchange Backup (Powershell) Sensor	⊘
Exchange Database DAG (Powershell) Sensor	⊘
Exchange Database (Powershell) Sensor	⊘
Exchange Mailbox (Powershell) Sensor	⊘

SENSOR ON LOCAL PROBE	PRTG ON DEMAND BETA
Exchange Mail Queue (Powershell) Sensor	⊘
Exchange Public Folder (Powershell) Sensor	⊘
EXE/Script Advanced Sensor	⊘
EXE/Script Sensor	⊘
File Content Sensor	⊘
File Sensor	⊘
Folder Sensor	⊘
HTTP Full Web Page Sensor	⊘
HTTP Push Count Sensor	⊘
HTTP Push Data Advanced Sensor	⊘
HTTP Push Data Sensor	⊘
Hyper-V Cluster Shared Volume Disk Free Sensor	⊘
Hyper-V Host Server Sensor	⊘
Hyper-V Virtual Machine Sensor	⊘
Hyper-V Network Adapter Sensor	⊘
Hyper-V Virtual Storage Sensor	⊘
IPFIX (Custom) Sensor	⊘
IPFIX Sensor	⊘
IPMI System Health Sensor	⊘

SENSOR ON LOCAL PROBE	PRTG ON DEMAND BETA
jFlow V5 (Custom) Sensor	⊘
jFlow V5 Sensor	⊘
Microsoft SQL v2 Sensor	⊘
MySQL v2 Sensor	⊘
NetFlow V5 (Custom) Sensor	⊘
NetFlow V5 Sensor	⊘
NetFlow V9 (Custom) Sensor	⊘
NetFlow V9 Sensor	⊘
Oracle SQL v2 Sensor	⊘
Oracle Tablespace Sensor	⊘
Packet Sniffer (Custom) Sensor	⊘
Packet Sniffer Sensor	⊘
PerfCounter Custom Sensor	⊘
PerfCounter IIS Application Pool Sensor	⊘
Port Range Sensor	⊘
Port Sensor	⊘
PostgreSQL Sensor	⊘
Python Script Advanced Sensor	⊘
QoS (Quality of Service) Round Trip Sensor	⊘

SENSOR ON LOCAL PROBE	PRTG ON DEMAND BETA
QoS (Quality of Service) One Way Sensor	⊘
sFlow (Custom) Sensor	⊘
sFlow Sensor	⊘
Share Disk Free Sensor	⊘
SMTP Sensor	⊘
SNMP Trap Receiver Sensor	⊘
Syslog Receiver Sensor	⊘
Windows MSMQ Queue Length Sensor	⊘
Windows Physical Disk I/O Sensor	⊘
Windows Print Queue Sensor	⊘
Windows Updates Status (Powershell) Sensor	⊘
Windows CPU Load Sensor	⊘
WMI Custom Sensor	⊘
WMI Custom String Sensor	⊘
WMI Event Log Sensor	⊘
WMI Exchange Server Sensor	⊘
WMI Exchange Transport Queue Sensor	⊘
WMI File Sensor	⊘

SENSOR ON LOCAL PROBE	PRTG ON DEMAND BETA
WMI Free Disk Space (Multi Disk) Sensor	⊘
WMI HDD Health Sensor	⊘
Windows IIS 6.0 SMTP Received Sensor	⊘
Windows IIS 6.0 SMTP Sent Sensor	⊘
Windows IIS Application Sensor	⊘
WMI Logical Disk I/O Sensor	⊘
WMI Memory Sensor	⊘
Windows Network Card Sensor	⊘
Windows Pagefile Sensor	⊘
Windows Process Sensor	⊘
WMI Remote Ping Sensor	⊘
WMI Security Center Sensor	⊘
WMI Service Sensor	⊘
WMI SharePoint Process Sensor	⊘
WMI Share Sensor	⊘
Windows System Uptime Sensor	⊘
WMI UTC Time Sensor	⊘
WMI Vital System Data Sensor	⊘
WMI Volume Sensor	⊘

SENSOR ON LOCAL PROBE	PRTG ON DEMAND BETA
WSUS Statistics Sensor	⊘
WMI Microsoft SQL Server 2005 Sensor (Deprecated)	⊘
WMI Microsoft SQL Server 2008 Sensor	⊘
WMI Microsoft SQL Server 2012 Sensor	⊘
WMI Microsoft SQL Server 2014 Sensor	⊘
WMI Microsoft SQL Server 2016 Sensor	⊘
WMI Terminal Services (Windows 2008+) Sensor	⊘
WMI Terminal Services (Windows XP/Vista/2003) Sensor	⊘
